

Hydrogen and Fuel Cells Technical Advisory Committee OE Priorities

Michael Pesin Deputy Assistant Secretary, Advanced Grid R&D

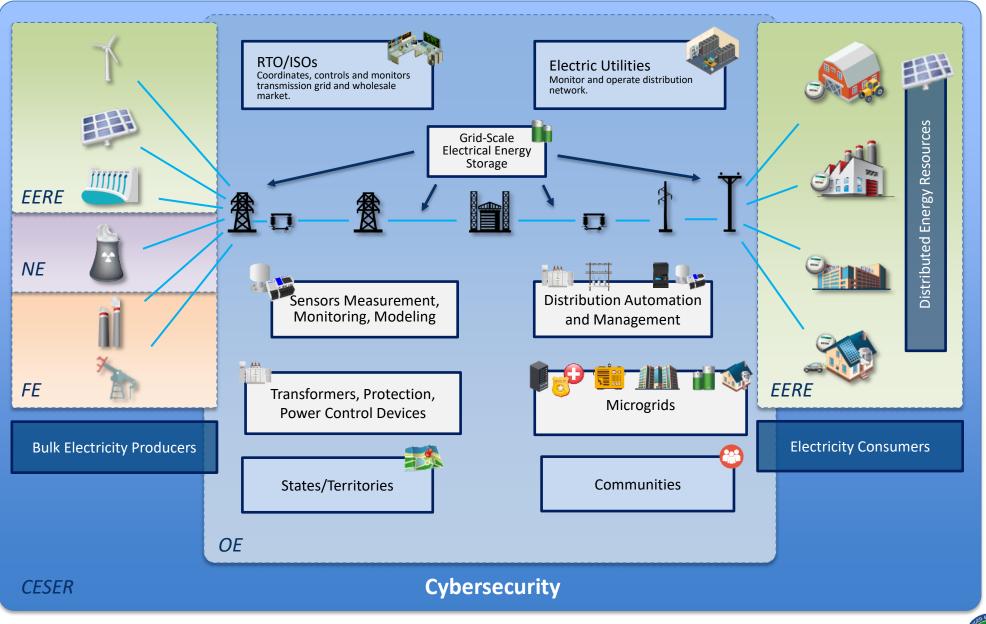

March 2019

Office of Electricity

- Provide national leadership to ensure a secure, resilient and reliable energy delivery system.
- Develop technologies to improve the infrastructure that brings electricity into our homes, offices, and factories.
- Support development of the federal and state electricity policies and programs that shape electricity system planning and market operations.
- Drive electric grid modernization and resiliency through research, partnerships, facilitation, and modeling and analytics.

Electric Power Grid

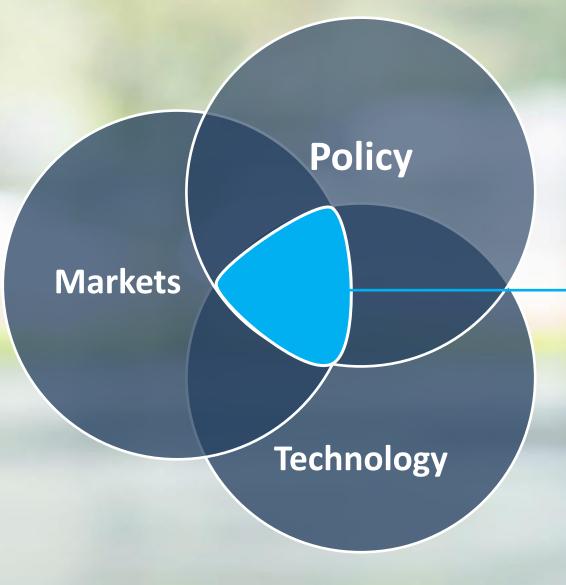

Advanced Grid R&D Programs At-A-Glance

Grid Controls and Communications	Transmission Reliability and Resilience	Synchrophasors		Advanced Grid Modeling		
	Resilient Distribution Systems	Advanced Distribution Systems		Advanced Microgrids Controls a Communica		High-Fidelity &
Grid Systems and Components	Transformer Resilience and Advanced Components	Advance	Low-Cost Sensors			
	Energy Storage Systems					

Grid Technology Commercialization

Interaction between Policy, Markets, and Technology.

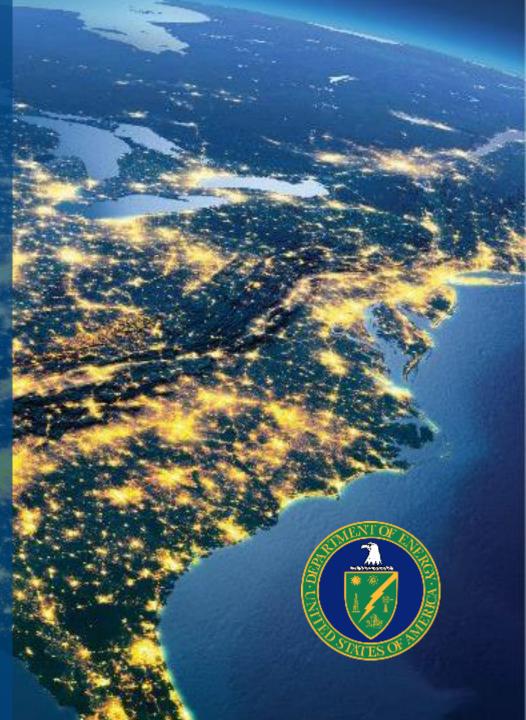

OE Key Priorities

North American Energy Resiliency Model

Megawatt Scale Grid Storage

Revolutionize Sensing Technology Utilization

Resilient Transmission Assets

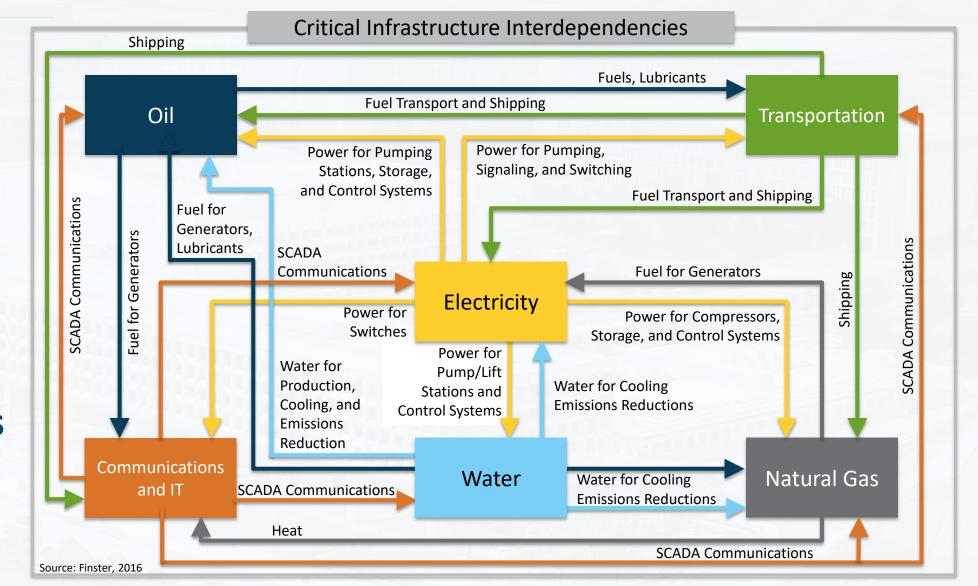

North American Energy Resiliency Model (NAERM)

Working with the national labs and relevant stakeholders, OE will develop an integrated North American Energy Resiliency Model (NAERM) to conduct planning and contingency analysis to address risks in the North American energy system.

- Incorporate relevant assets of the integrated energy grid.
- Identify potential infrastructure investments to improve resiliency and mitigate risks associated with energy system interdependencies.
- Produce a model that allows for sequencing of events to understand risk across critical energy infrastructure sectors and identifying key energy infrastructure interdependencies.

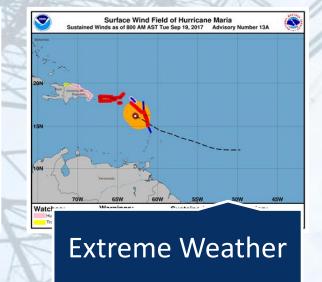

U.S. Critical Infrastructures Depend on Electricity

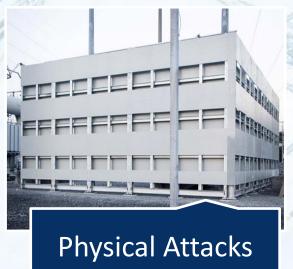

Many Threats Facing US Energy Infrastructure

High Altitude EMP

9

Protecting US Infrastructure Through Modeling

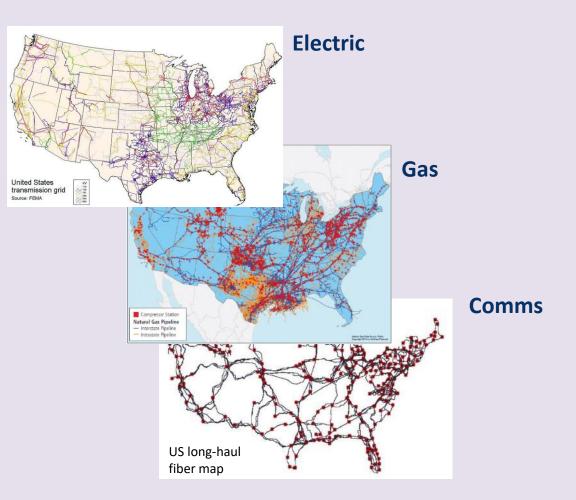

Vision

Rapidly predict consequences of known and emerging threats to national energy infrastructure.

Mission

Develop and sustain an engineeringclass modeling system to assess the national energy infrastructure.

North American Energy Resilience Model

Revolutionize Sensing Technology Utilization

Enable timely diagnosis, prediction, and
 prescription of all system variables and
 assets, during normal and extreme-event
 conditions, to support national security and
 national public health and safety

Develop, integrate, and revolutionize the use of high-fidelity, fast-acting sensor technologies and advanced data analytics in electricity delivery—from transmission to distribution to end-use load

OBJECTIVE

Resilient Transmission Assets

Pursue electricity-related policy issues by carrying out statutory and executive requirements, while also providing policy design and analysis expertise to states, regions, and tribes.

Critical Energy Infrastructure Information

- CEII program enables DOE to obtain valuable information from the private sector with additional reassurance that the data will be protected from disclosure.
- The data and information will enhance the Department's ability to fulfill its responsibilities in to secure the bulk-power system.

Megawatt Scale Grid Storage – Bidirectional Electrical Storage

The goal of the Energy Storage program is to lower system costs while simultaneously defining and articulating the value and benefits storage can provide across the grid infrastructure.

The program accelerates the progression of grid-scale energy storage technology in America to protect our grid and ensure our nation's leadership in an emerging global marketplace.

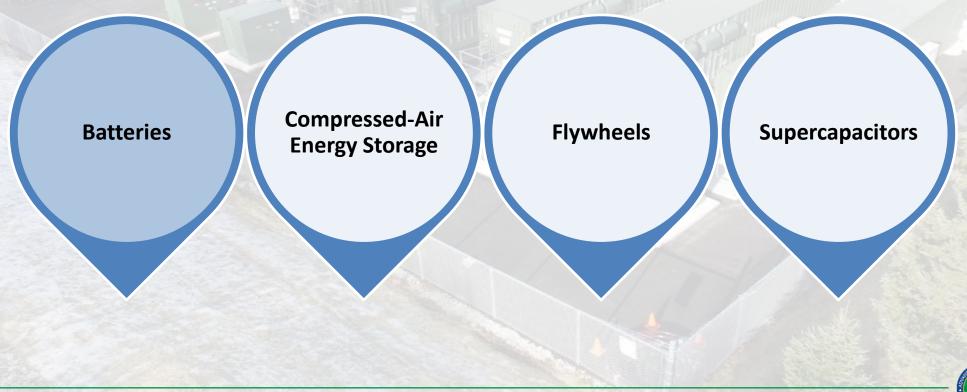

OE Investment - Beyond Lithium

Over 80% of U.S. large-scale battery storage power capacity is currently provided by batteries based on lithium-ion chemistries.

(U.S. Energy Information Administration, Form EIA-860, Annual Electric Generator Report.)

Scale – Safety - Cost

Megawatt Scale Grid Storage – Cost and Performance Priorities

- 1. Redox-Flow batteries with earth-abundant organic materials (target = ~\$100/kwh)
- 2. Transforming Zinc-Manganese Dioxide batteries to charge and discharge without significant degradation (target = ~\$25/kwh)
- 3. Sodium-based batteries that closely match Lithium-Ion's capacity
 (30% cost reduction over current market)

Storage Economics and Policy Implementation

- Capacity
- □ Arbitrage
- □ Regulation
- Spin/Non-Spin Reserves
- Voltage Support
- Black Start
- **Congestion Relief**
- T&D Upgrade Deferral
- **D** Power Reliability
- TOU Energy
- Charge ReductionDemand Charge Reduction

The Cost of a Storage System depends on the Storage Device, Power Electronics, and Balance of Plant

The Value of a Storage System depends on Multiple Benefit Streams, both monetized and unmonetized Energy Storage Device 25-50%

> Power Electronics 20-25%

Balance of Plant 20-25%

Grid Balancing Resources

Electrical Storage Batteries

Pumped Storage Hydro

Flywheels

Electric Grid

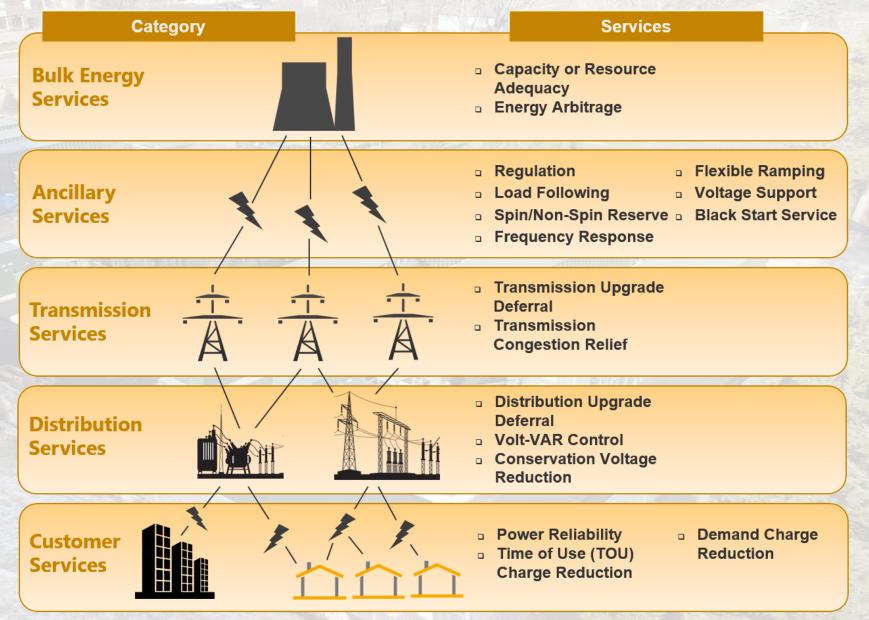

- Hydro, Fossil, Nuclear
- Variable Renewable with Smart Invertors

Flexible Generation Demand ResponseSmart EV Charging

Controllable Loads

Source: Pacific Northwest National Laboratory

Grid Services: Diverse, Complex, Regional, & Dynamically Variable

Service	Operational Objective	Time Scale	Event Duration	Recurrence	Power for Service
Peak Capacity Management	reduce net load to meet an infrastructure constraint	15-min to 1-hour	4-8 hours	10-15 days/yr	supply: up load: down
Capacity Market Value	supply reserve "generation" on demand	15-min to 1-hour	4-6 hours	~5 days/yr	supply: up load: down
Energy Price Response	reduce price spikes by shifting net load to low price periods	5-min	Real-time or day-ahead	continuously	supply: up & down load: down & up
Frequency Regulation	supplement power plants in continually balancing supply & demand	4-sec	continuously	continuously	supply: up & down load: down & up
Spinning Reserve	rebalance supply & demand after sudden loss of generation (or trans.)	~1-min	<2-hour	~15 times/yr	supply: up load: down
Artificial Inertia / Primary Frequency Response	arrest rapid frequency change & re- stabilize it during grid contingencies (usually loss of generation)	~1/60 sec	~1 or 10 -min	continuously	supply: up* & down load: down* & up
Distribution Voltage Management	minimize voltage fluctuations from rapidly changing PV output by injecting or consuming reactive power	~1-min	~1-hour/day	continually; especially on cloudy days	supply: up & down load: down & up
