

Research and Development in the Safety, Codes and Standards Program Element

Daniel Dedrick

Sandia National Laboratories

Antonio Ruiz

DOE Fuel Cell Technologies Program

October 15th, 2010

Multi-faceted approach to establishing technical basis for Codes and Standards

Identify R&D needs

- Facilitate stakeholder workshops, develop R&D roadmaps
- Analyze existing codes and standards, safety knowledge
- Participate actively in technical working groups

Perform High-Priority R&D

- Hydrogen behavior
- Risk Analysis
- Compatible materials and components

*Labs,
academia,
industry*

Impact Codes and Standards

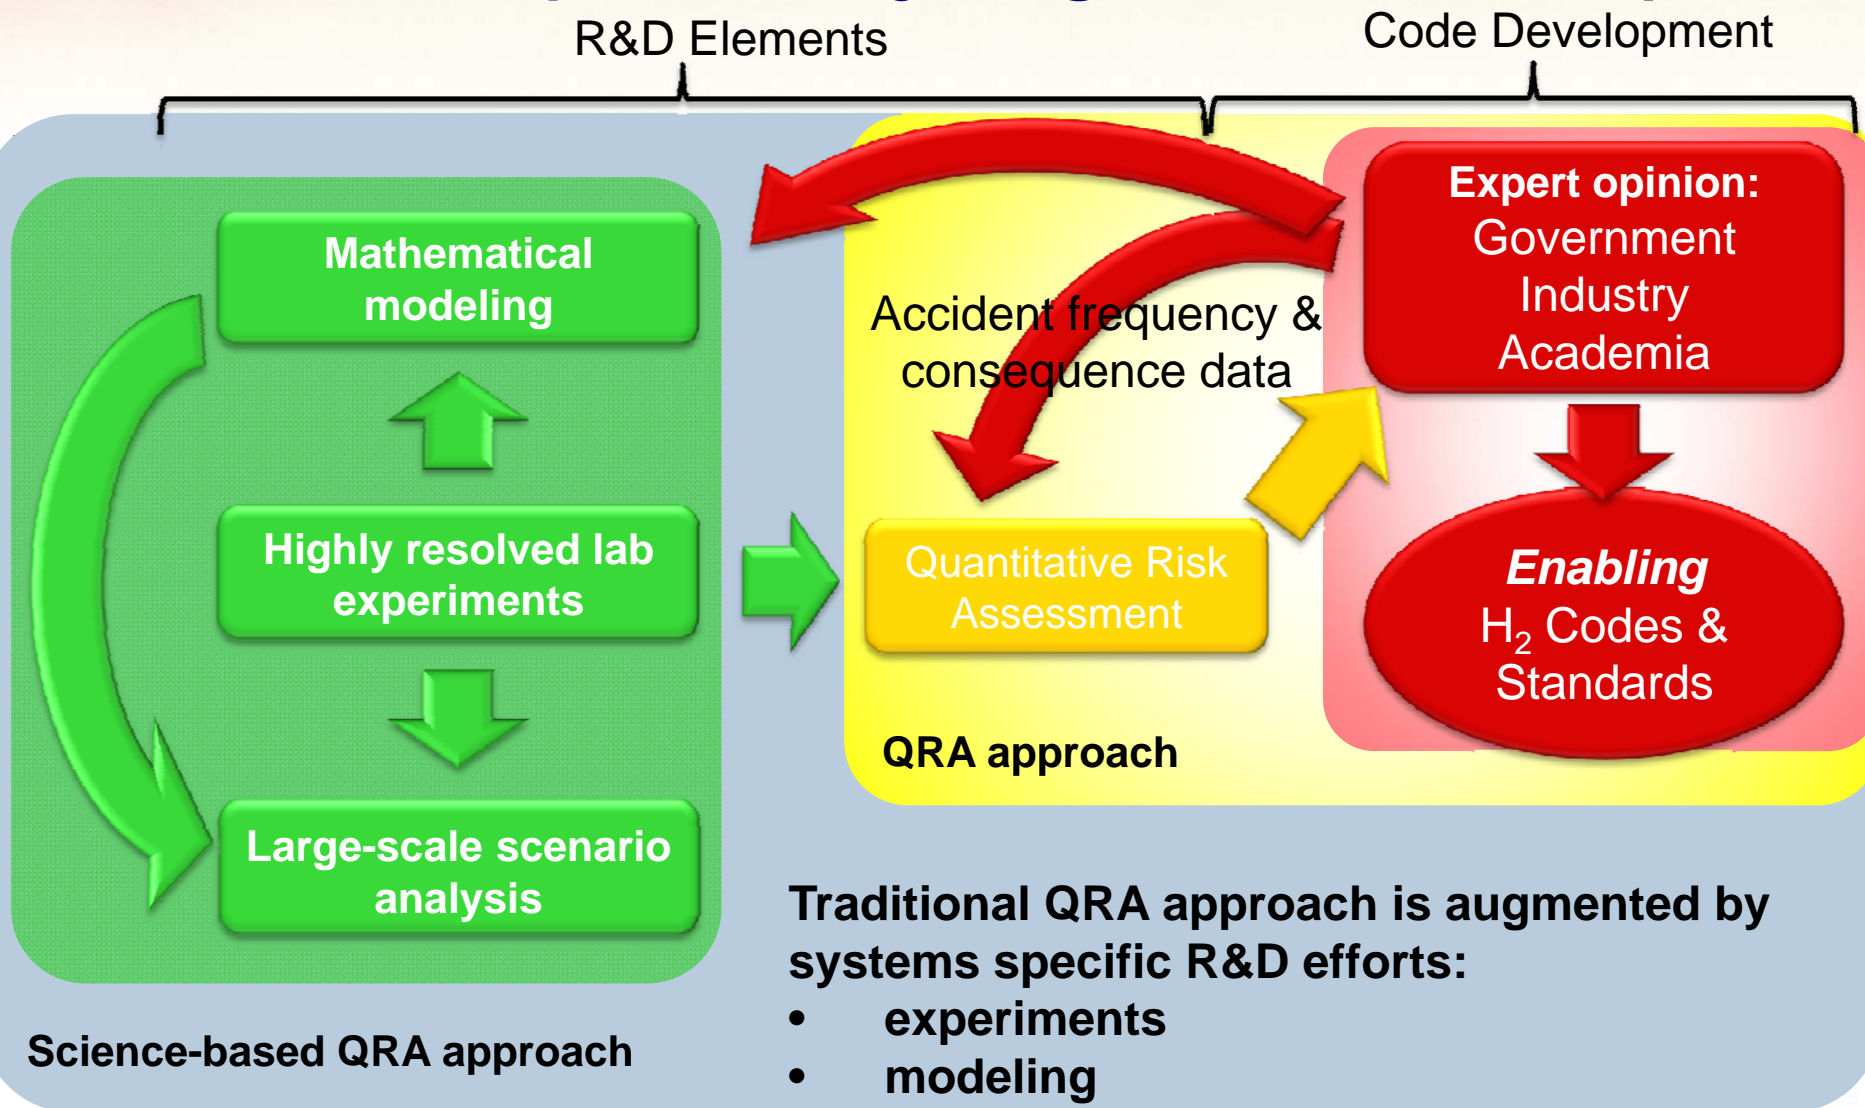

- Participate in technical committees to develop requirements
- Publish R&D results

Harmonize Internationally

- Regulations, Codes and Standards (RCS)
- International Standards (eg. ISO)
- International Agreements (IEA)

A science-based, risk analysis approach has been adopted for hydrogen C&S development

Each R&D program element is constructed to impact technology deployment

R&D Element	Input	Output
Hydrogen Behavior	Hydrogen utilization and technology information <ul style="list-style-type: none"> • Pressurized gas • LH₂ 	Safety data and validated models <ul style="list-style-type: none"> • ignition • dispersion • transport
Risk Analysis	Utilization information and requirements (indoor refueling, 700 bar storage)	<ul style="list-style-type: none"> • Safety requirements (eg. sep. distances) • Mitigation technology evaluations
H₂ Compatible Materials and Components	<ul style="list-style-type: none"> • Materials and systems performance requirements • Qualification requirements (efficiency, cost) 	<ul style="list-style-type: none"> • Optimized and validated test methods • Hydrogen specific materials data • Published data

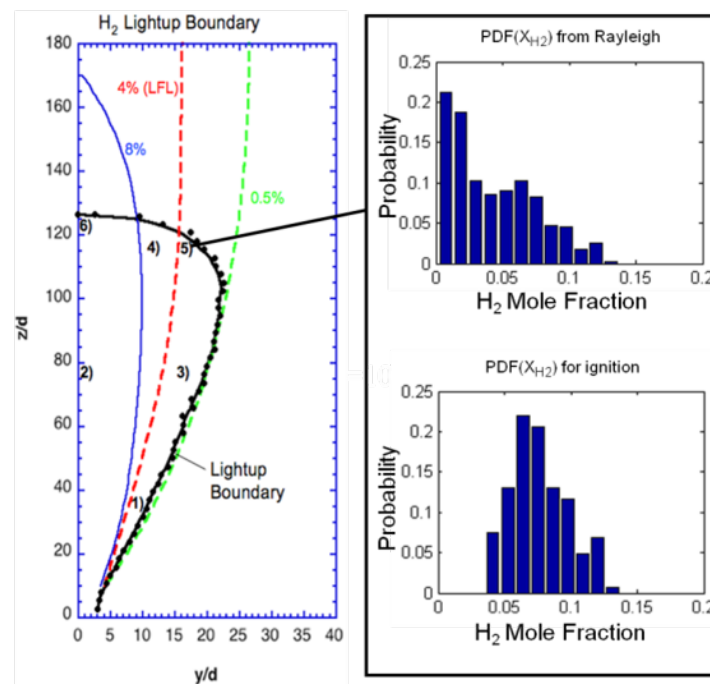

R&D in *Hydrogen Behavior* provides foundation for Risk Analysis

R&D Goal: Provide understanding of hydrogen dispersion and ignition at relevant temperature and pressure – develop validated models

Ignition behavior characterization

Provides the fundamental data to develop ignition and dispersion models

Separation Distances Define the Spatial Requirements

- Specified distances between a hazard and a target

- Established distances did not reflect high pressures (70 MPa)
- Basis for established distances are undocumented
- Several options to establish new separation distances
 - Subjective determination (expert judgment)
 - Deterministically, based on leak scenario
 - Based only on risk evaluation as suggested by the European Industrial Gas Association ([IGC Doc 75/07/E](#))

Risk-informed process combines risk information, deterministic analyses, and expert judgment

Appropriate and effective requirements

Validated models exercised to understand separation distances

Models validated at scale:

- Flame length
- Radiative fraction

SRI Test Facility
Baseline circular nozzle, 7.94 mm

Horizontal Flame
3.6 - 4.3 m long, 0.6 - 1 m wide

Use models to generate harm distances for a jet fire: 1.6 kW/m² heat flux

Consensus driven risk criteria

Validated separation distance look-up table:

Consequence Bases	Separation Distance			
	>0.19 to 1.72 MPa (>15 to 250 psig)	>1.72 to 20.68 MPa (>250 to 3000 psig)	>20.68 to 51.71 MPa (>3000 to 7500 psig)	>51.71 to 103.43 MPa (>7500 to 15000 psig)
100% radiative fraction	21.2m (20% Area)	26.1m (20% Area)	22.2m (20% Area)	28.2m (20% Area)
40% radiative fraction	13.2m (20% Area)	16.2m (20% Area)	14.2m (20% Area)	18.2m (20% Area)
10% radiative fraction	7.2m (20% Area)	9.2m (20% Area)	8.2m (20% Area)	10.2m (20% Area)
100% radiative fraction for 100% of 10000 people	15.2m (20% Area)	19.2m (20% Area)	17.2m (20% Area)	22.2m (20% Area)
100% radiative fraction for 100% of 1000 people	11.2m (20% Area)	14.2m (20% Area)	12.2m (20% Area)	16.2m (20% Area)
100% radiative fraction for 100% of 100 people	8.2m (20% Area)	10.2m (20% Area)	9.2m (20% Area)	12.2m (20% Area)
100% radiative fraction for 100% of 10 people	6.2m (20% Area)	8.2m (20% Area)	7.2m (20% Area)	10.2m (20% Area)
100% radiative fraction for 100% of 1 person	4.2m (20% Area)	6.2m (20% Area)	5.2m (20% Area)	8.2m (20% Area)
100% radiative fraction for 100% of 0.1 person	3.2m (20% Area)	5.2m (20% Area)	4.2m (20% Area)	6.2m (20% Area)
100% radiative fraction for 100% of 0.01 person	2.2m (20% Area)	4.2m (20% Area)	3.2m (20% Area)	5.2m (20% Area)
100% radiative fraction for 100% of 0.001 person	1.2m (20% Area)	3.2m (20% Area)	2.2m (20% Area)	4.2m (20% Area)
100% radiative fraction for 100% of 0.0001 person	0.8m (20% Area)	2.2m (20% Area)	1.8m (20% Area)	3.2m (20% Area)
100% radiative fraction for 100% of 0.00001 person	0.6m (20% Area)	1.8m (20% Area)	1.4m (20% Area)	2.2m (20% Area)
100% radiative fraction for 100% of 0.000001 person	0.4m (20% Area)	1.4m (20% Area)	1.0m (20% Area)	1.8m (20% Area)
100% radiative fraction for 100% of 0.0000001 person	0.3m (20% Area)	1.0m (20% Area)	0.8m (20% Area)	1.4m (20% Area)
100% radiative fraction for 100% of 0.00000001 person	0.2m (20% Area)	0.8m (20% Area)	0.6m (20% Area)	1.0m (20% Area)
100% radiative fraction for 100% of 0.000000001 person	0.15m (20% Area)	0.6m (20% Area)	0.45m (20% Area)	0.8m (20% Area)
100% radiative fraction for 100% of 0.0000000001 person	0.1m (20% Area)	0.45m (20% Area)	0.3m (20% Area)	0.6m (20% Area)

Risk-Informed Approach is a Critical Tool for Model Codes

- NFPA 55 voted to accept the new hydrogen bulk storage separation distances table
 - New table approved for NFPA 55 and 52 (available in 2010 editions)
 - New table to be included in NFPA 2
 - HIPOC supported inclusion in IFC by referencing back to the new table in NFPA 55 (available in 2010 edition of IFC).
- We have helped implement a similar approach into ISO TC197 WG11

- This provides a model for further C&S development:**
- R&D informs the code development process
 - Apply to requirements for liquid hydrogen, indoor refueling

FCT S,C&S program in action: development of requirements for forklift tanks

Participation in HIPOC – identify need to understand tank cycle-life

Assemble stakeholders – OEMs, SDOs, Labs (CSA HPIT1)

Measure properties of tank materials – predict cycle-life

Evaluate understanding at the component level – tank pressure cycle testing

Help develop requirements language – support publication of standard (CSA HPIT1)

Hydrogen Compatible Materials R&D provides understanding under relevant service conditions

R&D Goal: Provide fundamental understanding of H₂ effects in materials and develop appropriate test methods on protocols

• Cyclic loading

- Challenge: optimize frequency to balance data reliability and test duration

Materials Tech Reference:

- 22 material-specific chapters
- Content shaped by input from stakeholders

• H₂ gas pressure

- Relevant pressures up to 100 MPa

• Temperature

- Relevant temperatures from -50 °C to 100 °C

• Test methods

- Fatigue crack growth
- Fatigue crack initiation

Table of Contents			
Designation	Material composition	Code	Revision date
		0110	01/01
Plain Carbon Ferritic Steels			
A516-70	Fe-C-Mn	1100	01/01
Low Alloy Ferritic Steels			
Quenched & Tempered Steels			
A514	Fe-C-Mn	1211	01/01
A517	Fe-C-Mn	1212	01/01
High Alloy Ferritic Steels			
High Strength Steels			
A508-Cl.1	Fe-Mn-Ni-Cu-B	1401	01/01
A509	Fe-Mn-Ni-Cu-B	1402	01/01
Ferritic Stainless Steels			
A182	Fe-Ni	1800	01/01

R&D in H₂ Compatible Materials impacts code development and technology deployment

- Stationary pressure vessels
 - ASME Article KD-10
 - Fatigue data in H₂ used to qualify new steel-lined Type 2 vessel design

- Forklift tanks
 - CSA Hydrogen Powered Industrial Trucks (HPIT)
 - H₂ gas cycle testing of tanks providing guidance on fatigue life

FCV fuel system components

- SAE J2579
- Tensile fracture data for H₂-exposed stainless steels defined effects of alloy composition and temperature

Future efforts will continue to address R&D gaps for C&S development

R&D Element	Research areas (partial list)
Hydrogen Behavior	<ul style="list-style-type: none"> • Low-temperature dispersion and ignition behavior (Cryo and LH₂) • Materials-based storage • Global ignition models
Risk Analysis	<ul style="list-style-type: none"> • Mitigation technologies, sensors (NFPA 2) • Telecom APU sheds, separation distances (NFPA2) • LH₂ storage separation distances (NFPA 2) • Advanced storage technologies (SAE J2578, CSA, UL...)
H₂ Compatible Materials and Components	<ul style="list-style-type: none"> • Accelerated materials and systems qualification (ASME, CSA, UL, SAE) • Welded components • Aluminum alloys • Low-alloy steels • Hydrogen effects at low temperature • Composite materials

Scope defined in partnership with industry, SDOs, and academia

Additional Slides

We validate understanding at relevant scales

- “Spontaneous ignition” mechanisms investigated
- Repeatable ignition from spark discharges between isolated conductors were observed

Sample B
Iron (III) Oxide
 Fe_2O_3

200x

Provides understanding for ignition models

Consequence analysis provides context for assessment of indoor refueling

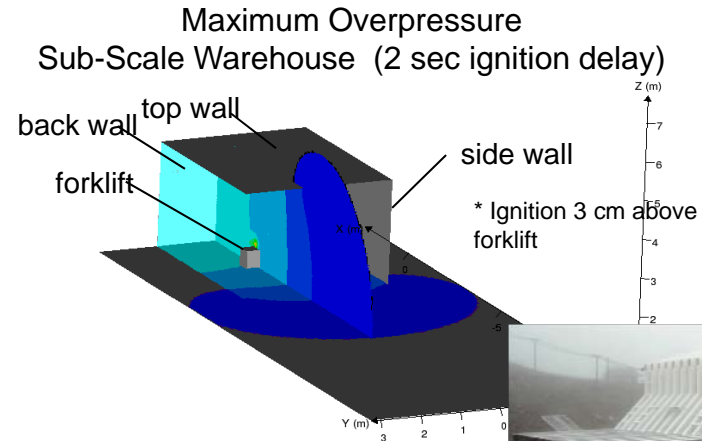

R&D Goal: Provide understanding of consequence of hydrogen safety events – develop validated models

We are evaluating requirements in NFPA 52 with OEM input to define indoor release scenarios

CFD: Flammable Volume 3 sec into Release

Deflagration Overpressure*

Job=200002. Var=PMAX (bar). Time= 1.080 (s).
X=-11.8 : 2.26, Y=-3.3 : 3.2, Z=0.03 : 7.4 m

Experimental validation in sub-scale warehouse

Provides basis for hazard mitigation and safety requirements (NFPA 2)
