

Weak Chemisorption Validation

**2013 U.S. DOE HYDROGEN and FUEL
CELLS PROGRAM ANNUAL MERIT
REVIEW and PEER EVALUATION
MEETING**

Thomas Gennett

May 15, 2013

This presentation does not contain any proprietary, confidential, or otherwise restricted information

Overview

Timeline

Start: October 2010
End: September 2013
% complete: ~95%

Budget

- Total project funding \$995k
- Funding received in FY11: \$765k (\$220k)
- Funding for FY12: \$210 (10k)
- Funding for FY13: \$20k (15k)

1 subcontract continued in FY 13
Amount in parentheses

Barriers addressed

General: A. Cost, B. Weight and Volume,
C. Efficiency, E. Refueling Time
Reversible Solid-State Material:
M. Hydrogen Capacity and Reversibility
N. Understanding of Hydrogen
Physi- and Chemisorption
O. Test Protocols and Evaluation
Facilities

Partners (PI)

University of Hawaii - Craig M. Jensen (active)
University of New Mexico - Plamen Atanassov
Max Planck, Stuttgart, Germany - Michael Hirscher
Institut de Chimie et des Matériaux – Paris, France -
Michel Latroche, Claudia Zlotea

Collaborators: *Penn State - Angela Lueking; Griffith University - Evan Gray; Curtin University - Craig Buckley SWRI® - Mike Miller; Caltech – Channing Ahn; NIST – Craig Brown.*

Relevance:

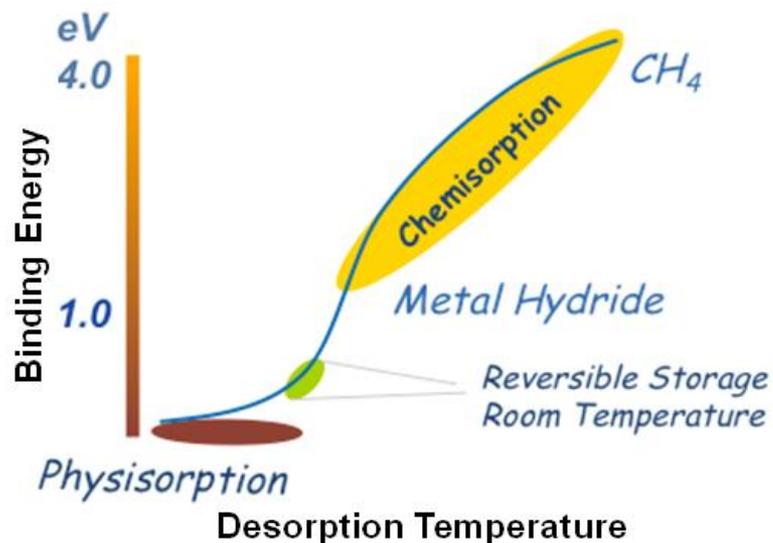

•DOE Objective:

Evaluate the spillover process as a means to achieve DOE 2017 Hydrogen Storage goals.

•Project Goal:

- Validate measurement methods.
 - Reproducibility
 - Round-robin measurements of standards at several sites (ST014)
- Identify and synthesize several candidate sorbents for spillover.
- Determine hydrogen sorption capacity enhancement from spillover.
- Observe and characterize spillover hydrogen-substrate interactions with spectroscopic techniques.

Binding Energy and Sorption-Desorption

RELEVANCE: Hydrogen Storage: Spillover Process

Hydrogen storage on metal-doped carbon materials, via “**spillover**” mechanism, involves a series of steps:

- Molecular H₂ dissociates on the metal catalyst particle.
- Atomic H migrates to the carbon support.
- Atomic H diffuses across the carbon surface.

ALL AT ROOM TEMPERATURE

Claims:

In literature anywhere from < 0 to > 400% enhancement associated with spillover (up to 4% w/w reversible sorption/desorption at 30 °C.

Reproducibility Issues:

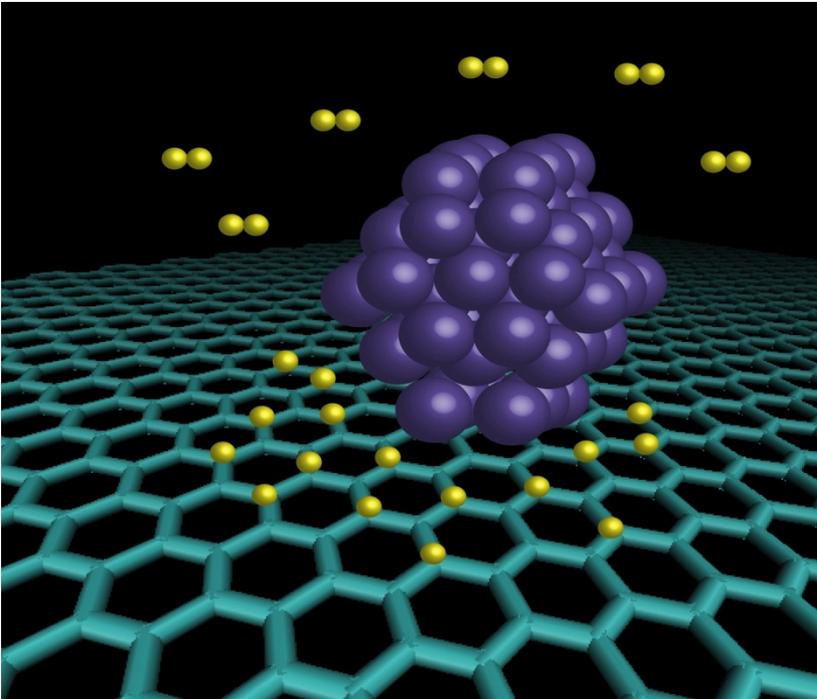

Systematic/Measurement error(s)

Synthesis Issues

Cyclability

Catalyst/Matrix stability

Thermodynamics/kinetics issues

Approach – FY11-12 Milestones

2011	1	Complete standard sample(s) exchange and measurement validation	11/2010	100% complete
	2	Exchange initial set of spillover samples. Coordinate focus group efforts at IEA-HIA Task 22 Meeting (Australia) (subcontract/NDA delays of milestone)	01/2011	100% complete
	3	Complete Weak Chemisorption Focus Group meeting and report initial recommendations (at DOE Annual Merit Review)	05/2011	100%
	4	Establish type of C-H interaction from targeted materials.	07/2012	100% complete
	5	Complete evaluation of weak chemisorption process from exchanged materials.	07/2011	100%
	6	Complete meeting open to general public who may be interested, to report results on exchanged weak chemisorption samples. Was held at ACS meeting in Denver.	08/2011	100% complete

Approach – FY 11-12 Milestones

2012	1	Complete 2 nd round of sample(s) exchange and measurement validation [Dec. 2011]	12/2011	100% complete
	2	Coordinate focus group efforts at NREL Workshop Meeting	01/2012	100% complete
	3	Complete round robin synthesis efforts and report results.	03/2012	100% complete
	4	Complete Weak Chemisorption Focus Group meeting and report recommendations at DOE Annual Merit Review	05/2012	100% complete
	5	Based on identified C-H interactions, determine ultimate potential for weak chemisorption based hydrogen storage	05/2012	100% complete
	6	Complete evaluation of the experimental results for weak chemisorption process exchange including the MOF and bridged MOF materials. [July 2012]	07/2012	100% complete
	7	Report results of exchanged weak chemisorption samples and synthesis processes with the different collaborators to quantitatively confirm the observed hydrogen adsorption/desorption behavior for MOFs. Provide to DOE Annual Report.	08/2012	100% complete

Approach: FY 13 Milestones:

2013	1	Conduct and correlate high pressure NMR spectroscopy results with NREL DRIFTS to determine the specific C-H interactions involved in weak chemisorption based hydrogen storage.	06/2013	90% complete
	2	Determine the upper limit of hydrogen uptake via wt% due to spillover in an optimized substrate matrix	09/2013	50% complete

APPROACH: Spillover Collaboration

- **Objective:**
 - Demonstrate reproducibility of enhanced adsorption spillover effects.
 - Establish whether spillover is a viable process for hydrogen storage.
- **Approach:**
 - Validate observations for a narrow range of spillover material systems with at least 15% hydrogen sorption enhancement.
 - Synthesize and distribute targeted materials for group analysis.
 - Perform spectroscopic characterization using IR (DRIFTS), NMR, Neutron Scattering, *NEXAFS*.
 - Incorporate new information within mechanistic models.
- **Goals:**
 - Ascertain H/H₂-catalyst-substrate interactions and mechanisms.
 - Establish reproducibility of synthesis and validity of measurements.
 - Establish whether DOE targets can be reached.
 - Communicate validated results to community at large.

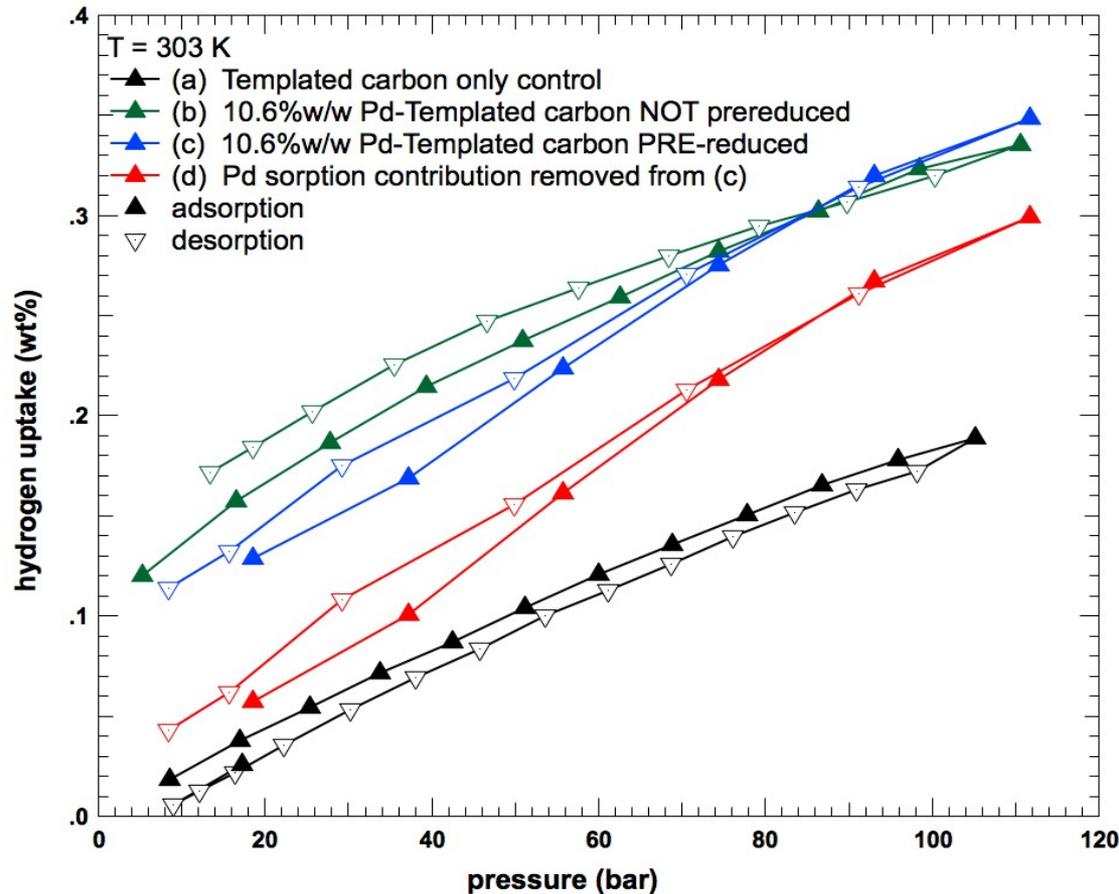

Materials systems chosen for DRIFTS-NMR Study:

- **Pd/Templated Carbon (ICPME/NREL) (FY13)**
- **Pd/BC_x (NREL)**
- **Ru/BC_x (NREL)**

Technical Accomplishments and Progress:

Pd-TC Reversible Room Temperature Sorption (Previously Reported)

Volumetric adsorption isotherms for hydrogen sorption on a Pd-TC sample.

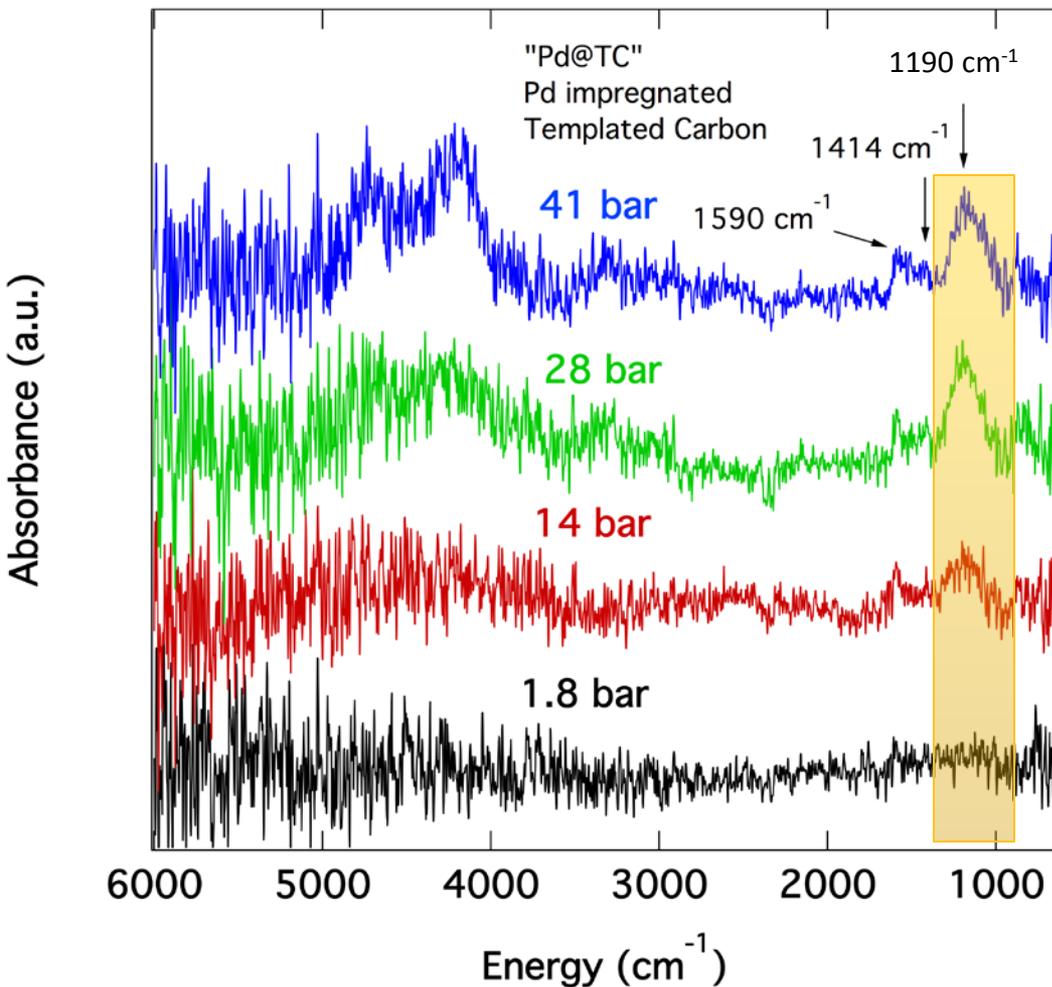

- (a) templated carbon blank control sample for baseline adsorption;
- (b) as-received, degassed Pd-TC not pre-reduced;
- (c) degassed, hydrogen reduced, degassed Pd-TC sample;
- (d) the red curve is the data from (c) with the Pd hydrogen storage contribution removed.

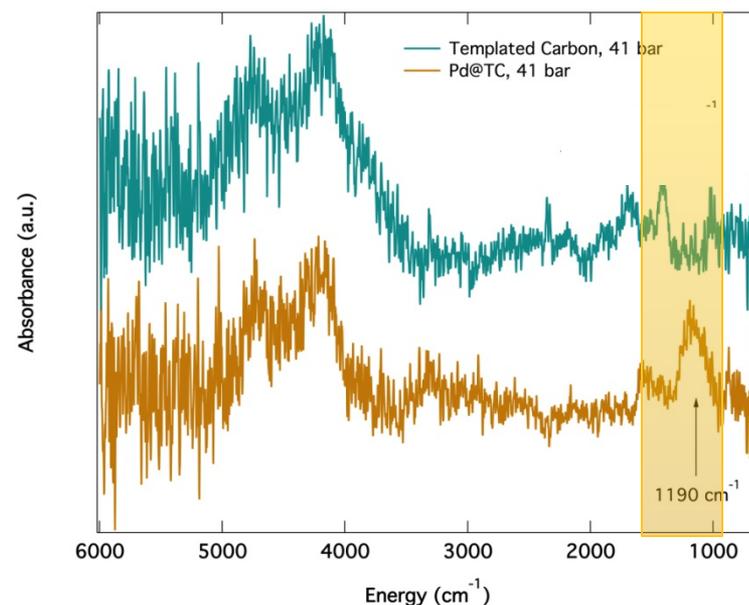

Lack of metal-oxide pre-reduction can lead to erroneous sorption measurements. Significant enhancement of sorption observed after metal contribution is removed for Pd-TC materials. A multi-laboratory verification of a reversible enhanced hydrogen sorption via spillover at room temperature

Technical Accomplishments and Progress

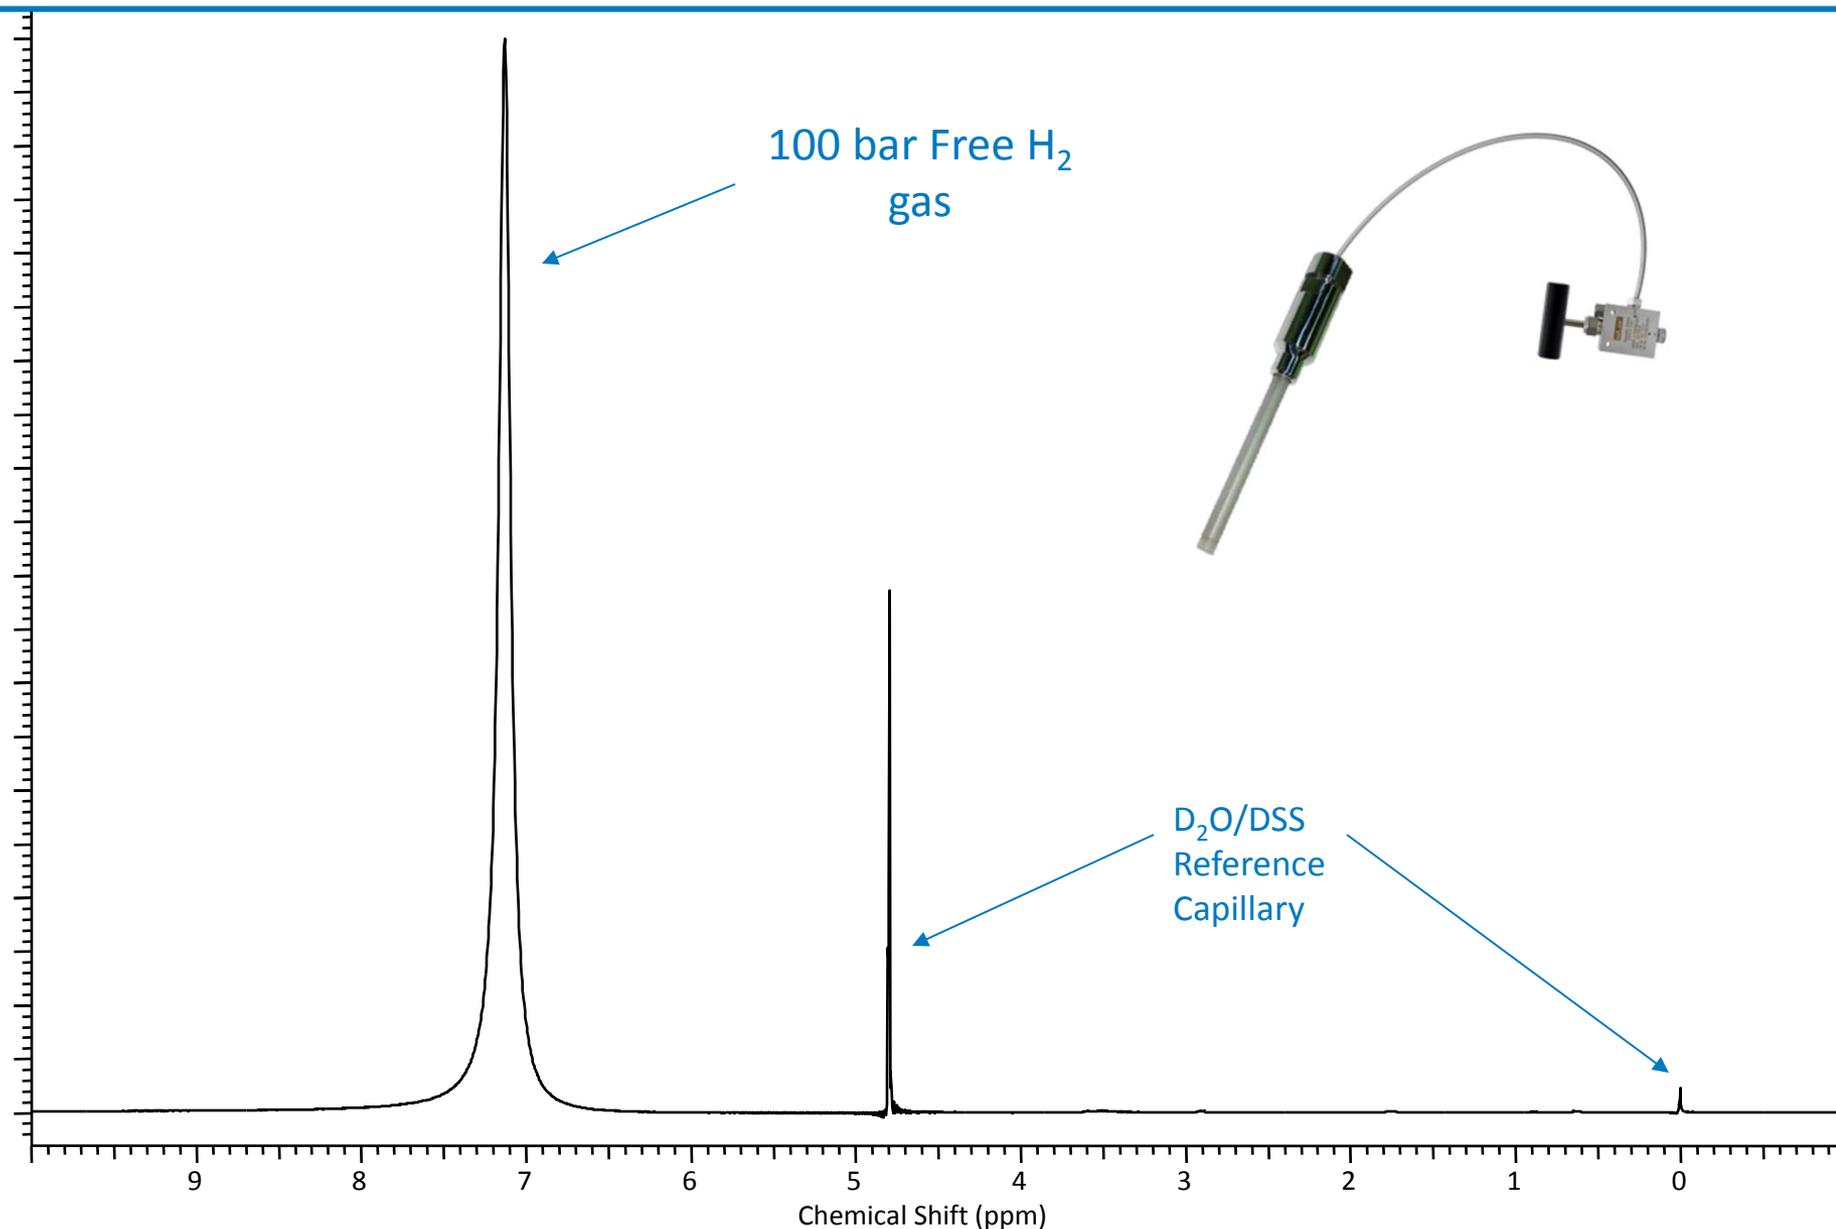

DRIFTS of Pd-TC material

- $\text{PdH}_2 < 1000 \text{ cm}^{-1}$
- Stretches from 1400 - 1600 cm^{-1} on both TC and Pd/TC
- **Reversible C-H stretch at 1190 cm^{-1} for Pd-TC.**
- Results are the same for samples synthesized at NREL and ICPME.

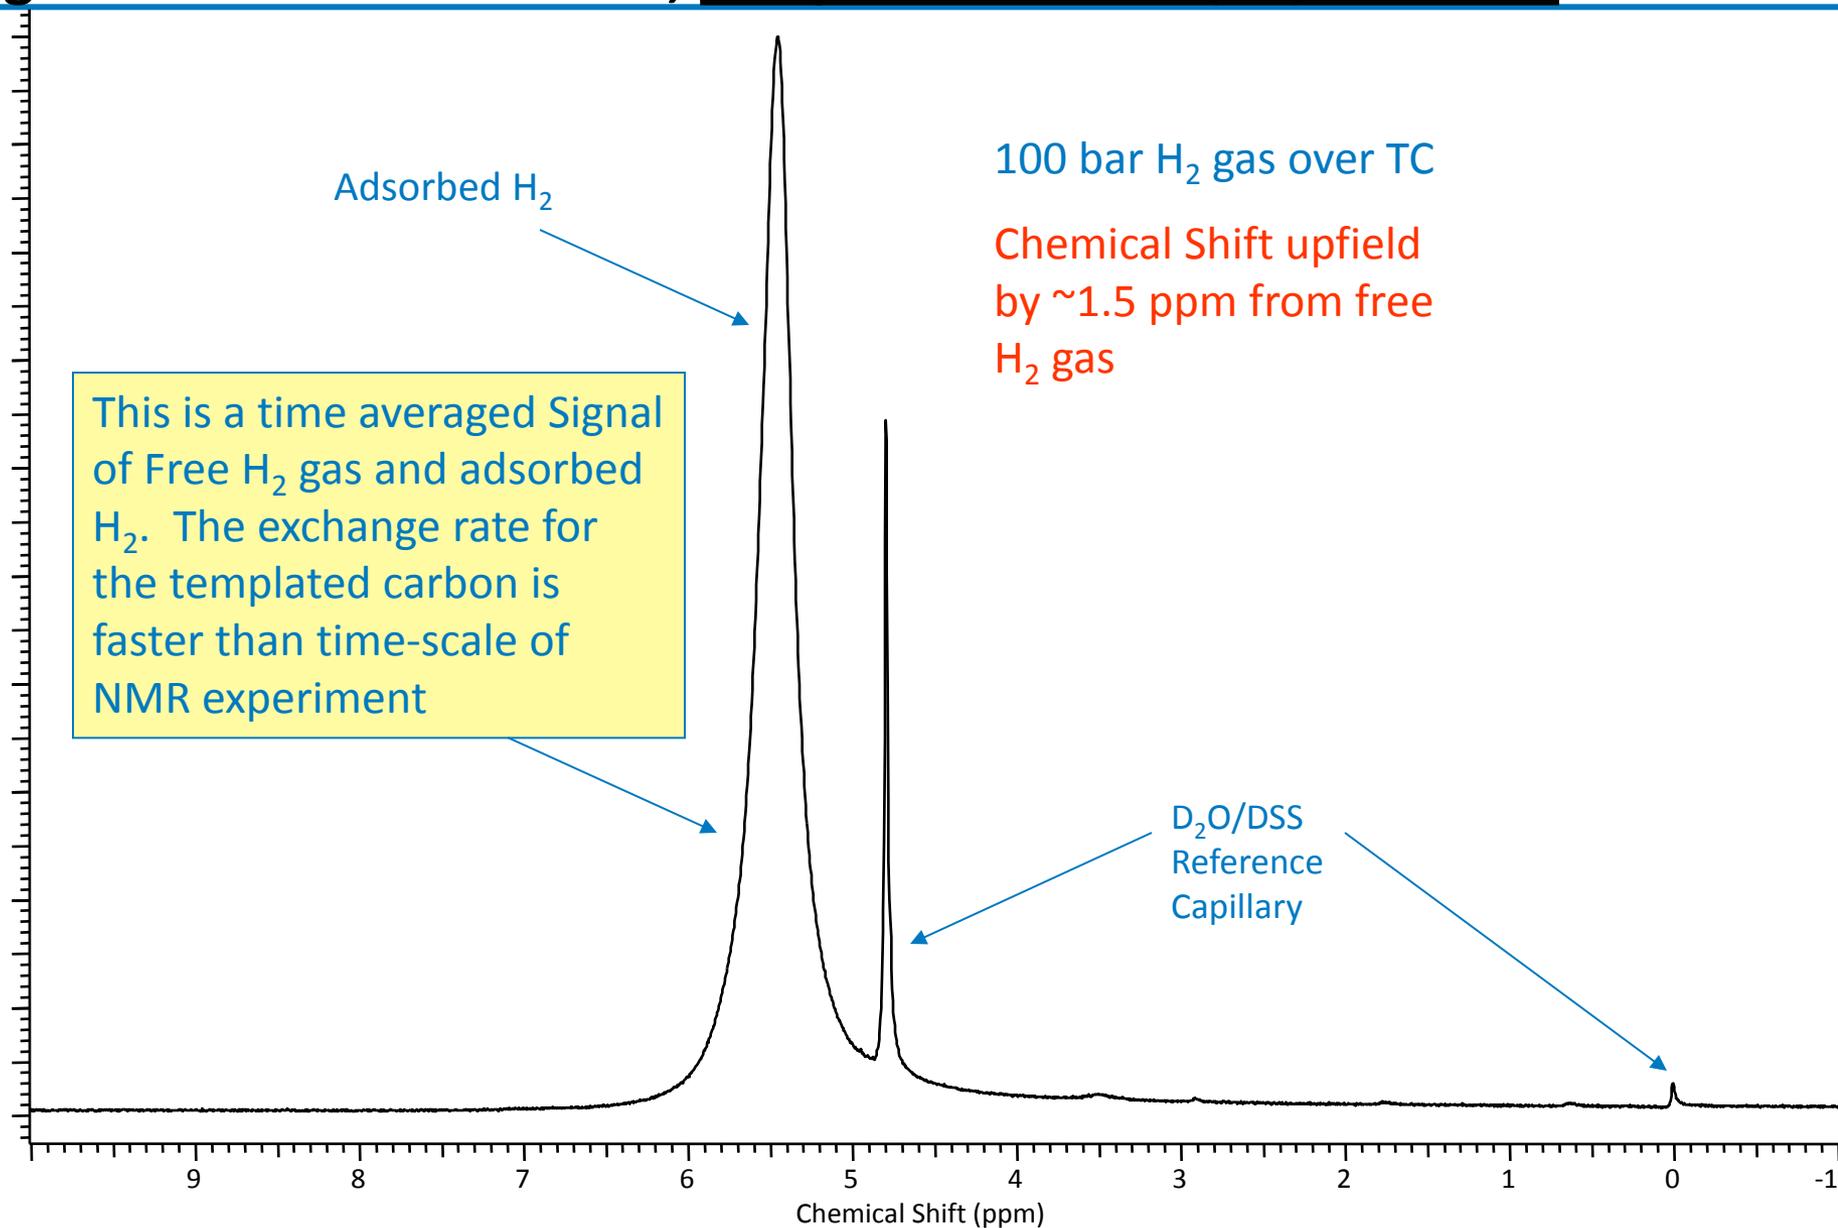

Technical Accomplishments and Progress: High Pressure NMR: Empty Vessel

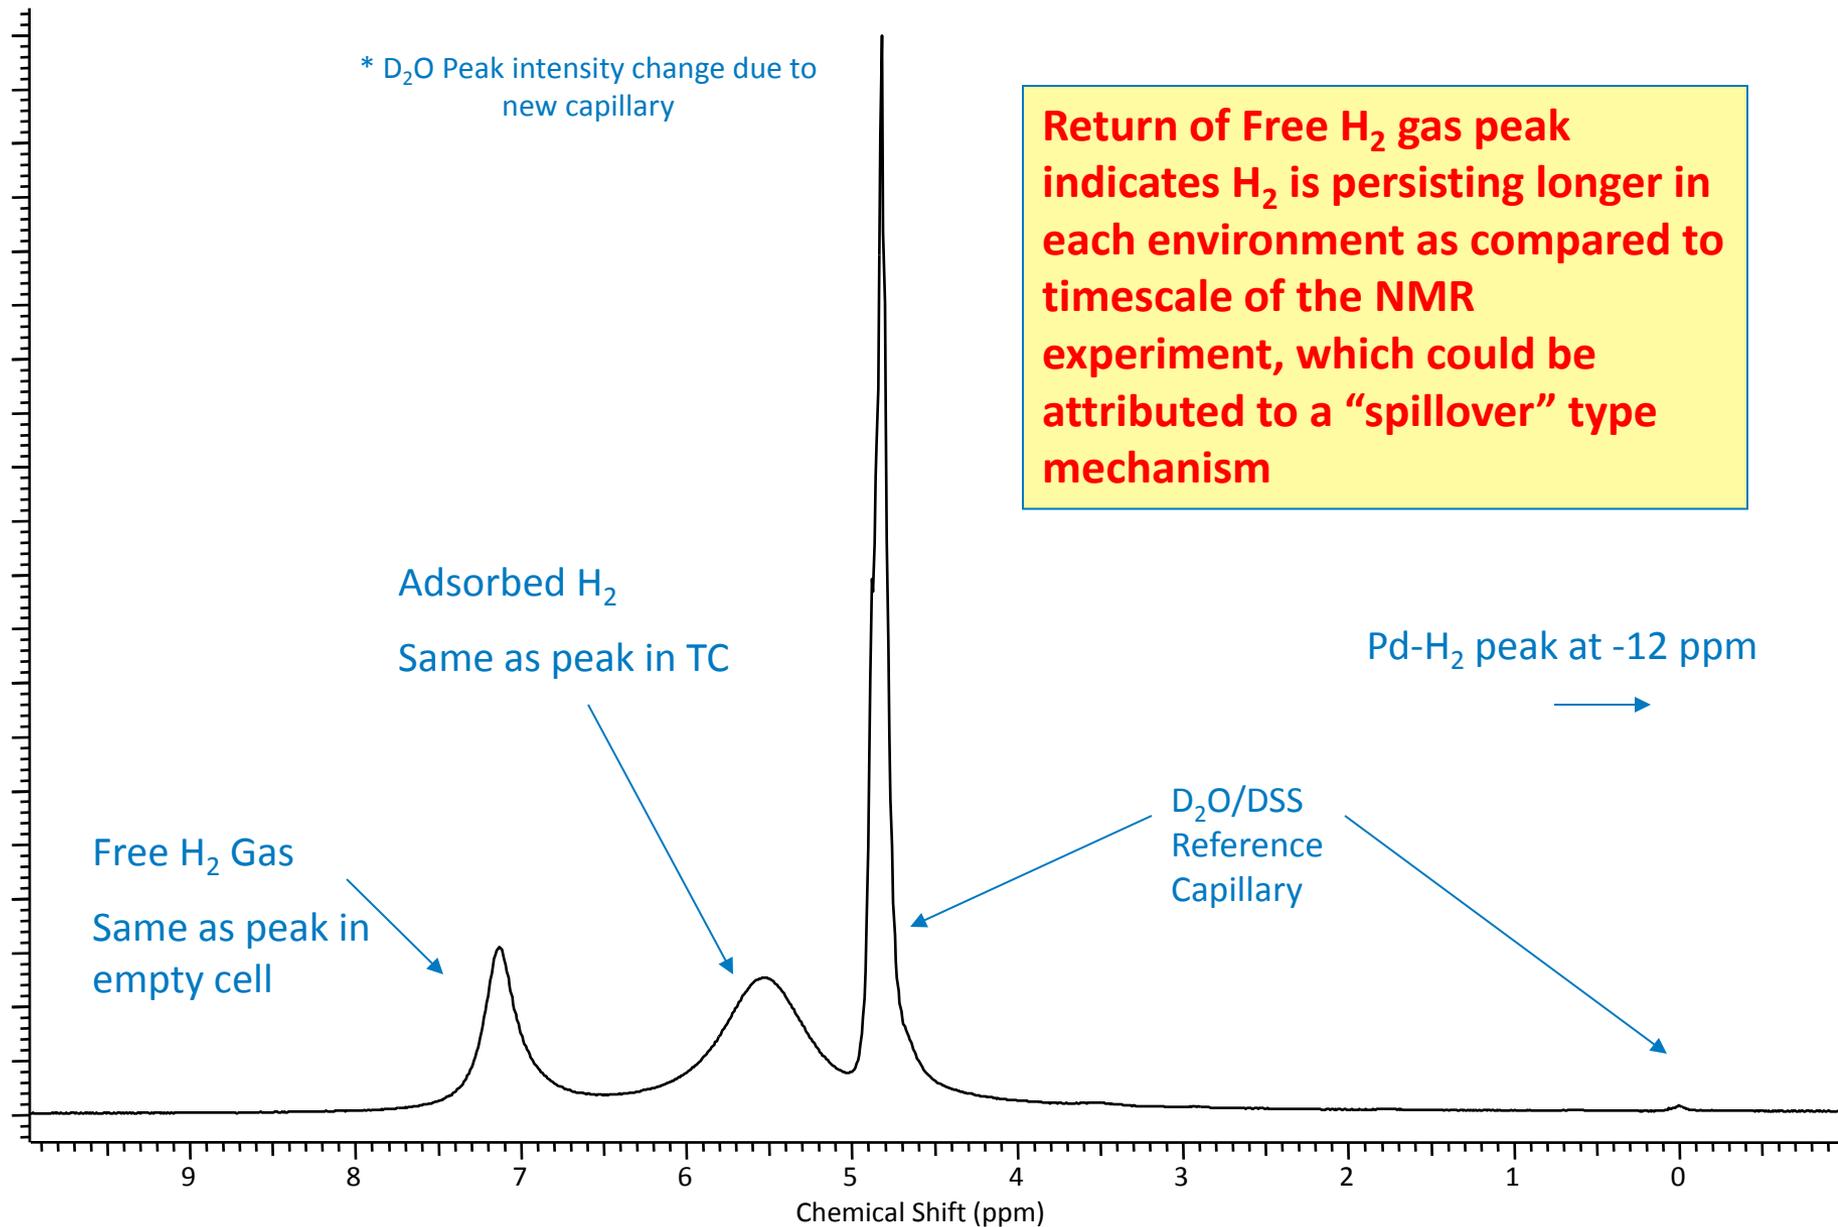

Technical Accomplishments and Progress:

High Pressure NMR Results, Templated Carbon (TC) no metal

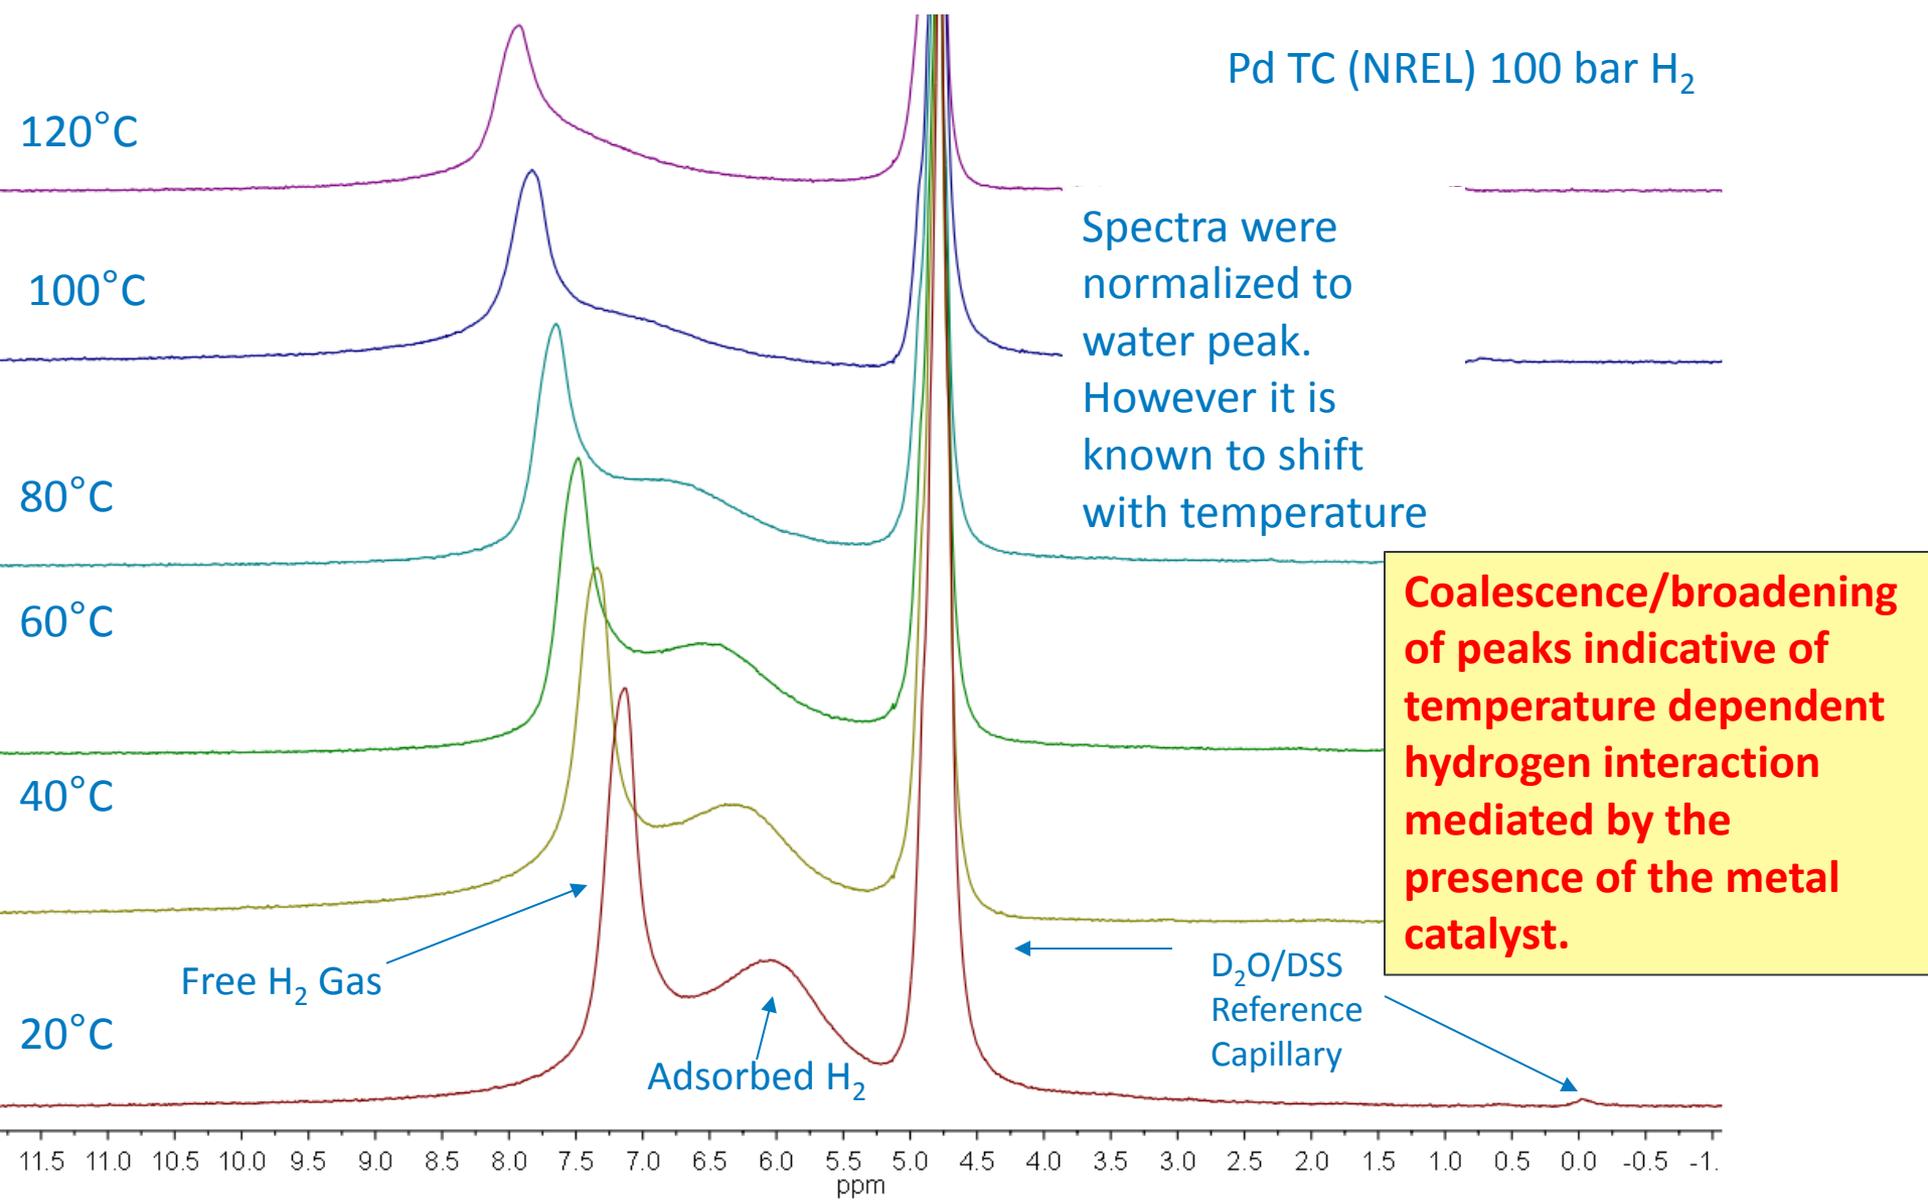

Technical Accomplishments and Progress: High Pressure NMR

Experiments: 100 bar H₂ gas over Pd-Templated Carbon

Technical Accomplishments and Progress: Variable Temperature NMR

Summary and Conclusions

Pd-TC DRIFTS data similar to RuBCx DRIFTS results

Ru-BCx NMR no-go because of paramagnetic nature of Ru(III) in complex

Pd-BCx material undergoing variable temperature NMR experiments

Pd-TC variable temperature NMR

- Free H₂ (7.2 ppm) and carbon substrate (6 ppm) hydrogen gas peaks indicates H₂ is persisting longer in each environment.
 - (Pd-H₂ peak is about -12 ppm)
- Coalescence of peaks indicates temperature dependence.
 - Low temperature experiments planned to completely resolve peaks.(probe temperature limits ill-defined)
 - Approximate ΔH^* will be calculated from line fitting analysis of peak

Summary of Experimental observations/limitations of current spillover-sorbent materials

- **Activated Carbon**
 - Condensation reactions dominate
 - Solvent contamination
 - Metal oxidation state
- **Bridged Frameworks**
 - Incomplete pyrolysis of sucrose
 - Condensation reactions
 - Framework reactions

Weak Chemisorption Collaborators

Future Work

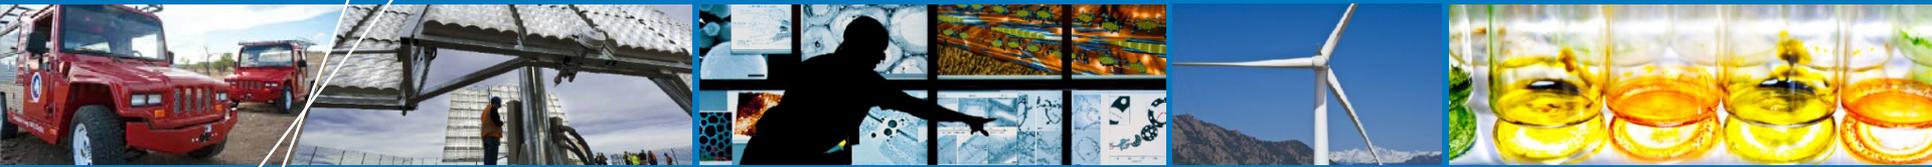

- **Reconcile spillover propagation mechanisms**
 - Reconcile mechanism with metal mediated processes with different substrate matrices.
 - Investigate new weak bond or localized catalytically activated interaction.
 - Use metal dispersion effects to establish whether current enhancements are localized or if there is evidence of long-range interactions.
- **Determine ultimate spillover capacity possible with optimized interactions and substrate chemistry**
 - Investigate pore structure.
 - Design materials to enhance diffusion across substrate surface away from metal sites.
 - Establish whether PdBCx shows comparable enhancement to PdTC.
- **Establish ability to quantify hydrogen adsorption via DRIFTS and/or NMR spectroscopic techniques**
 - Investigate whether or not volumetric enhancements match new spectroscopic data.
 - Analyze Pd-TC and Pd-BCx materials via DRIFTS and NMR.
 - Utilize Spectroscopic techniques to calculate Isosteric Heats of adsorption

Suggest BES/NSF fundamental level work:

- **Hydrogen Spillover mechanism on sorbents needs to be established to better define substrate chemistries needed to optimize sorption capacities.**

Summary

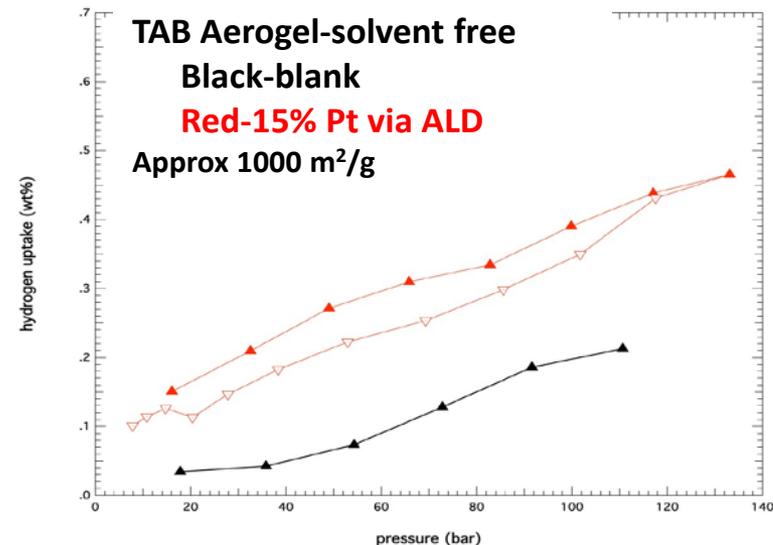

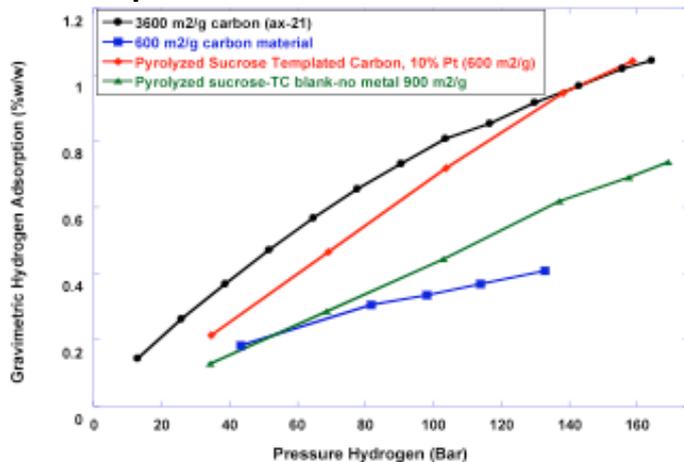

- **Relevance:**
 - Evaluation the spillover process as a means to achieve DOE 2015 Hydrogen Storage goals.
 - Validation of measurement methods.
 - Determination of hydrogen sorption capacity enhancement from spillover.
- **Approach**
 - Validate observations for a narrow range of spillover material systems with at least 15% hydrogen sorption enhancement in multiple laboratories.
 - Synthesized and distributed targeted materials for group analysis.
 - Spectroscopic characterization, IR (DRIFTS), NMR
- **Accomplishments & Progress**
 - First **DIRECT** spectroscopic evidence of a reversible room temperature sorption/desorption apparently from a unique C-H interaction via DRIFTS, NMR and Neutron Scattering spectroscopy techniques.
 - Variable temperature NMR illustrated the rate of hydrogen exchange on substrate metal dependent
 - Multi-laboratory observation of effect that metal oxide can have on hydrogen capacity measurements in metal-mediated sorption process.
- **Collaborations**
 - 4 groups worked on verification of “spillover”.
 - 11 groups focused on measurement techniques and procedures.
- **Proposed Future Work**
 - Reconciliation of spillover propagation mechanisms to theoretical models
 - Determination of ultimate spillover capacity possible once completely establish/optimize interactions and substrate chemistry.
 - Quantification of hydrogen sorption with the high pressure spectroscopic techniques. (DRIFTS, NMR)

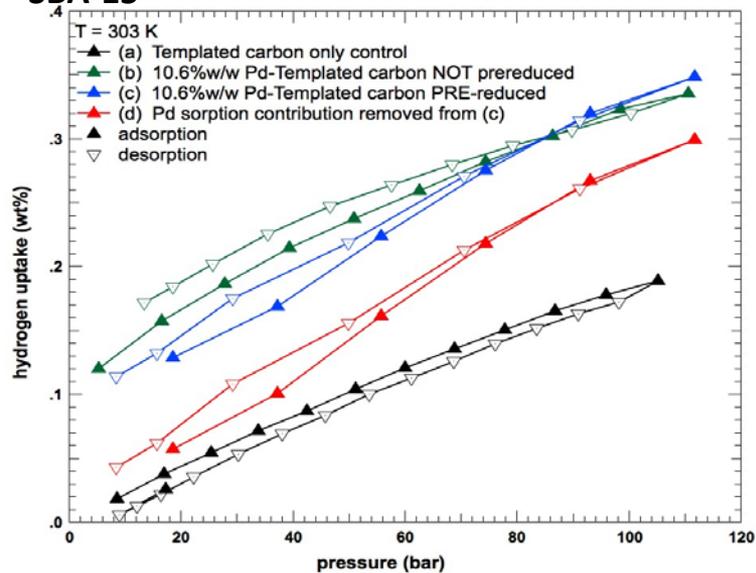

Technical Back-Up Slides

Hierarchal Carbon Materials with Pt/Pd

UNM: Silica-sphere templated-carbon with defined pore structures

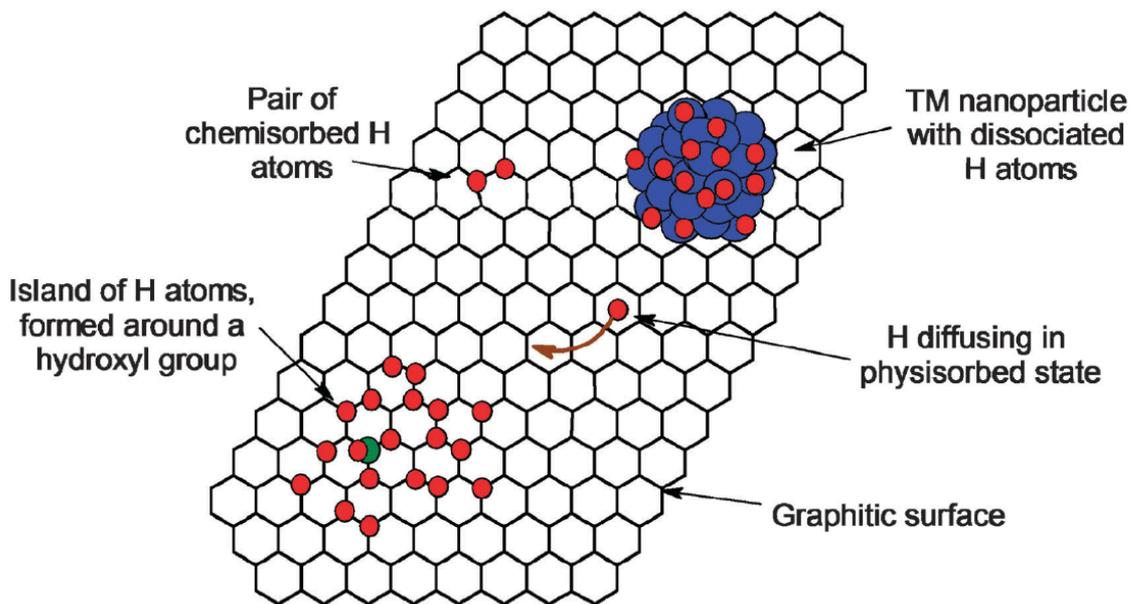

ICPME and NREL templated carbon from SBA-15

Have observed 10 to 100% increase in hydrogen sorption properties of well defined materials low capacity materials. DRIFTS, NMR, Neutron studies confirm reversible adsorption/desorption behavior.

BES level work, mechanism needs to be established to better define substrate chemistries needed to optimize sorption capacities.

Future Work: Must Define phenomenon, fundamental basis for new interaction(s)

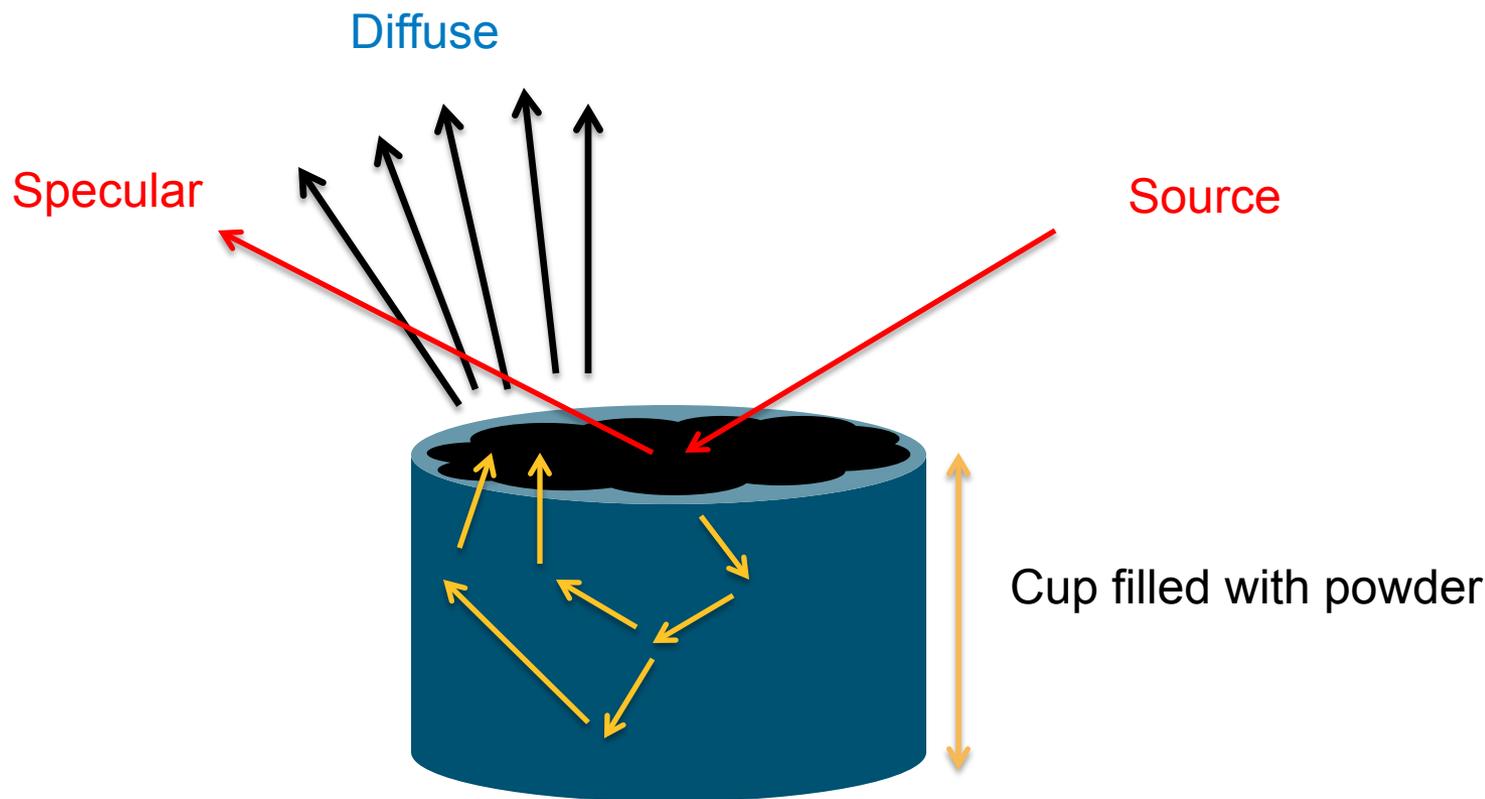

- The illustration shows the proposed mechanism for hydrogen spillover on metal-doped graphitic materials with adsorbed oxygen functionalities.

- Mobile H atoms are generated on the metal nanoparticles and migrate in physisorbed atomic state on graphite.

- The H atoms **chemisorb** preferentially around surface oxygen groups or other surface irregularities.

- Small amounts of chemisorbed hydrogen (>200 °C desorption) is observed even when no metals are present

Approach: Principles of DRIFTS

- Align with known organic material – e.g. carboxymethyl cellulose
- Align such that specular reflection is not collected, but diffuse reflectance is
- All spectra are taken relative to background
- Background taken on sample under ~ 0.5 bar H_2
