**P#:FC 37**

# Project Overview

## Effect of Fuel and Air Impurities on PEM Fuel Cell Performance

### Timeline

“Started” FY05  
End date not established  
25% Complete

### Barriers

B. Cost  
C. Fuel Cell Performance  
A. Materials Durability

### Budget

100% DOE  
Total FY05 = \$800k

### Partners

**ORNL:** *MEA material analysis (Karren More)*  
**USFCC** (Materials and Components Working Group)  
**Technical Training**

- University of California, Berkeley
- University of Oklahoma
- De Nora N.A. ETEK

# Project Objectives

**Overall Objective:** Contribute to DOE effort in developing an efficient, durable, direct hydrogen fuel cell power system for transportation.

## Specific goals:

- Evaluate the effects of fuel and air impurities on FC performance
- Evaluate catalyst durability under the effects of impurities
- Investigate effect of impurities on other FC components
- Find ways to mitigate negative effects of impurities.
- Continue collaborations with Industry and other National Laboratories

# Project Objective: Identifying Origins of Impurities in FC

- Fuel Impurities
- *Hydrogen source and Reforming Process*

*Natural gas*  
*Gasolines*  
*Diesel*  
*Methanol*       $\longrightarrow$       **CO, NH<sub>3</sub>, H<sub>2</sub>S, HCN**

- Air Impurities
  - \* *From fuel combustion pollution:* **SO<sub>2</sub>, NO<sub>2</sub>, diesel fumes**
  - \* *From natural sources:* **Ocean salts, dust**
- Other
  - \* *De-icers:* **NaCl, CaCl<sub>2</sub>**
  - \* *Corrosion products from FC system:* **cations**

***During the last six months studies focused H<sub>2</sub>S, and SO<sub>2</sub>***

# Project Objective: Understanding Impurity Adsorption Effects

- Impurities may adsorb onto:
  - Pt surface
    - CO, H<sub>2</sub>S, SO<sub>2</sub>, Cl<sup>-</sup>
  - Carbon support
    - H<sub>2</sub>S, SO<sub>2</sub>
  - Ionomer
    - M<sup>+</sup>, NH<sub>4</sub><sup>+</sup>
  - Gas diffusion layer
    - Salts, wetting agents

- Impurities block reaction sites for chemisorption, charge transfer and/or impede protonic conduction.
- Also changes GDL properties

# Technical Approach

- *Study the effects of ambient air impurities on FC performance (e.g. SO<sub>2</sub>, NO<sub>2</sub>, NaCl).*
- *Study the effects of low concentrations H<sub>2</sub>S on anode performance.*
- *Study the effects of impurities under dry and humidified gas flows*
- *Investigate the effects of actual diesel combustion fumes.*
- *Determine specific effects of impurities on FC component (e.g. catalysts, membrane and GDL)*
- *Find materials and devices able to mitigate negative effects of impurities.*
- *Test procedures for reactivating electrodes poisoned with sulfur compounds.*
- *Collaborate with USFCC to develop a “Single Cell Testing Protocol”.*

## Technical Accomplishments

Month-Year	Milestone	Status
Feb 05	Report results of a method for cleaning sulfur-poisoned cathode Pt-catalyst with minimum interruption of cell operation.	<i>completed</i>
May 05	Report results of a method for cleaning sulfur-poisoned anode Pt-catalyst with minimum interruption of cell operation.	<i>completed</i>
Jun 05	Determine cathode threshold tolerance levels to SO <sub>2</sub> .	<i>in progress</i>
Jul 05	Determine cathode threshold tolerance levels to NO <sub>2</sub>	<i>In progress</i>
Aug 05	Complete tests with actual diesel exhaust.	<i>in progress</i>
Sept 05	Identify potential approaches to attain sulfur tolerant catalysts.	<i>in progress</i>

# Effect H<sub>2</sub>S on FC Performance

## Pt-Cu (1:1) Anode Catalyst

- H<sub>2</sub>S irreversibly poisons Pt-Cu catalysts
- Operation on clean air does not reactivate the catalyst.
- Pt-Cu catalyst does not offer any advantage in comparison to Pt catalysts

H<sub>2</sub>/Air FC TF624 (5cm<sup>2</sup>)  
 N112 A: 0.22 mg Pt/cm<sup>2</sup> (20% Pt-Cu[1:1] ETEK)  
 C: 0.21 mg Ptc/m<sup>2</sup> (20%Pt-C ETEK)  
 T<sub>cell</sub> : 80 °C , PSIG: 30/30

# Effect of SO<sub>2</sub> on performance with dry and humidified air

Measurements at 0.6 A/cm<sup>2</sup> constant current  
1.5 ppm SO<sub>2</sub> injected at the cathode inlet

- The negative effect of SO<sub>2</sub> is more acute in dry air.
- Dry clean air does not affect performance under these conditions.

TF625-50 cm<sup>2</sup> ; N112,  
A: 0.21 mg Pt/cm<sup>2</sup>  
C: 0.22 mg Pt/cm<sup>2</sup>  
T<sub>cell</sub>: 80 °C, P: 30 psig  
T<sub>humidifier</sub>: A/C: 105/80 °C  
H<sub>2</sub>/Air: 1.3/2.0 stoich

# Determining cathode threshold tolerance level to SO<sub>2</sub>

A total of 0.011  $\mu\text{moles}$  of SO<sub>2</sub> injected at the cathode air inlet in each case

\* Normalized voltage changes at 0.60 A/cm<sup>2</sup> constant current

\* Under these conditions and exposure time, the threshold deleterious SO<sub>2</sub> level is between 0.1 and 0.25 ppm.

\* Voltage drop is due to catalyst poisoning (see next slide)

H<sub>2</sub>/Air FC,  
TF626, 50 cm<sup>2</sup>, N112, 80 °C  
A: 0.21 mg Pt/cm<sup>2</sup> (20% Pt/C, ETEK)  
C: 0.22 mg Pt/cm<sup>2</sup> (20% Pt/C, ETEK)

# Determining cathode threshold tolerance level to SO<sub>2</sub>

(Cont'd)

CV of partially poisoned cathode after  
3.2 hrs of exposure to 1.5 ppm SO<sub>2</sub>

- \* SO<sub>2</sub> poisoning decreases H-adsorption
- \* SO<sub>2</sub> is oxidized at high potential
- \* 3<sup>rd</sup> cycle CV features indicates that the Pt catalyst becomes clean

- \* Charge values for H-desorption and for SO<sub>2</sub> oxidation also show that the threshold value lies between 0.25 and 0.1 ppm.

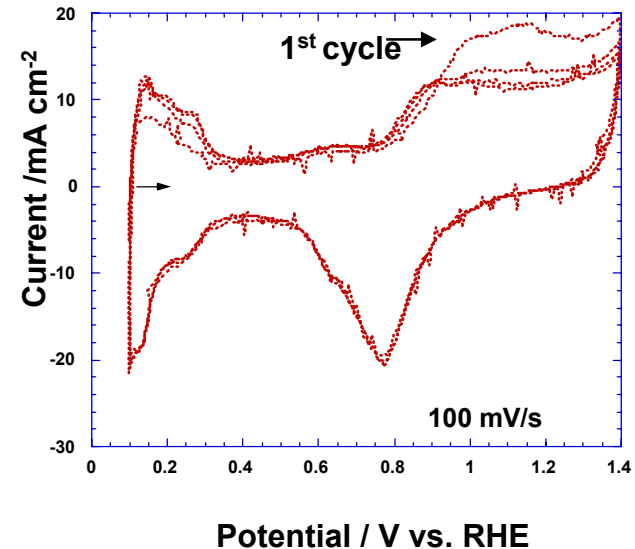

# SO<sub>2</sub> as an air impurity

## Effect on the cathode catalyst

5 ppm SO<sub>2</sub> injected at the cathode

CV after 17.6 hr exposure / 5 ppm SO<sub>2</sub>

- \* Cathode catalyst poisoning by SO<sub>2</sub> is irreversible
- \* In-situ voltammetric polarization (CV to 1.4 V vs. RHE) results in a complete cathode catalyst reactivation
- \* This reactivation cannot be carried-out during normal cell operation.

# H<sub>2</sub>S as fuel impurity

## Effect on the anode catalyst

1 ppm H<sub>2</sub>S injected at the anode

CV before and after full poisoning with 1 ppm H<sub>2</sub>S

- \* Anode catalyst poisoning by H<sub>2</sub>S is irreversible
- \* *In-situ* voltammetric polarization (CV to 1.4 V vs. RHE) results in a complete anode catalyst reactivation
- \* This reactivation cannot be carried-out during normal cell operation.

# Cleaning Sulfur ( $\text{SO}_2$ ) Poisoned Cathode Pt-Catalyst

H<sub>2</sub>/Air FC, N112, 5cm<sup>2</sup>  
 A: 0.18 mg Pt/cm<sup>2</sup> (20% Pt/C)  
 C: 0.22 mg Pt/cm<sup>2</sup> (20% Pt/C)  
 P: 30/30; T: 80/105/80°C

*\* A current-voltage pulse is applied to the cell using an external power supply*

*\* Performance recovery is practically complete*

## Cleaning Sulfur ( $\text{H}_2\text{S}$ ) Poisoned Anode Pt-Catalyst #

*\* A current-voltage pulse is applied to the cell using an external power supply*

*\* Recovery of performance is almost complete*

50  $\text{cm}^2$  cell, Nafion 112  
A: 0.22  $\text{mgPt}/\text{cm}^2$  ;  
C: 0.22  $\text{mgPt}/\text{cm}^2$   
 $\text{H}_2$ : 1.3 stoich; Air: 2.0 stoich /  $T = 80^\circ\text{C}$

# Special Task: USFCC Single Cell Test Protocol

(Materials and Components Working Group)

- \* Major Goal: Develop a Conventional Test Protocol that includes:
  - Measure  $H_2$  crossover*
  - Initial break-in procedure*
  - Generate reproducible polarization curves at given conditions*
- \* A set of 4 equivalent 50 cm<sup>2</sup> cells tested in several laboratories
  - Round Robin Testing Participants:*
    - LANL*
    - Teledyne*
    - Greenlight Power Technologies*
    - Electrochem Technologies*
- \* Data Collection and Report: LANL
  - Presentations: *FC Seminar, San Antonio, TX , 2004*
  - *ECS Meeting, Quebec City, Canada, May 2005*

# Technical Accomplishments and Progress Summary

- 1 . Completed milestones up to date.*
- 2. Demonstrated a simple procedure for reactivating Sulfur- poisoned catalysts from exposure to SO<sub>2</sub> and H<sub>2</sub>S.*
- 3. The procedure does not require gas purging or and expensive instrument and is carried out in few minutes.*
- 4. Demonstrated that the negative effects of SO<sub>2</sub> on the cathode are more severe under dry conditions.*
- 5. Actively participated in the USFCC by developing and performing the “Single Cell Testing Protocol”. LANL carried the first and the last set of measurements in the round robin.*

# Future Work

1. Dependence of the effects of  $\text{H}_2\text{S}$ ,  $\text{SO}_2$  and  $\text{NO}_2$  on operating conditions such as: temperature, relative humidity and operating current or voltage.
2. Modeling performance including the effects of these impurities, starting with  $\text{H}_2\text{S}$  and  $\text{SO}_2$  whose effects are best known.
3. Study the adsorption of  $\text{H}_2\text{S}$  and  $\text{SO}_2$  on carbon supports.
4. Study the effects of diesel fumes as a function of temperature and relative humidity.
5. Electrochemical testing of the effects of impurities will include complementary gas chromatography analysis. We are implementing GC for measuring low impurity levels for  $\text{SO}_2$ ,  $\text{NO}_2$  and  $\text{H}_2\text{S}$ .
6. Continue studying the effect of salts ( $\text{NaCl}$  and  $\text{CaCl}_2$ ) on performance. Test will include performance of pre-exposed components (catalyst layer, membrane and GDL).

## 2004 Reviewers Comments

1. The effect of SO<sub>2</sub> is reported but methods to reverse the effect are not proposed.

*Here we present a simple method for reactivation of severely sulfur-poisoned Pt catalysts.*

2. Can benefit from more focused systematic study on effects of one factor that is considered to be most important.

*Emphasis on effects of sulfur compounds on FC performance during this period*

3. Collaboration with USFCC is valuable - industry needs test protocol for establishing/measuring impurity levels of H<sub>2</sub> specification because existing specifications are inappropriate

*This collaboration has continued with strong LANL participation*

# Hydrogen Safety

The most significant hydrogen hazard associated with this project is:

*Hydrogen leak in the hydrogen supply leading to accumulation in the room with ignition leading to an explosive event.*

# Hydrogen Safety

- Our approach to deal with this hazard is:
- *In labs with hydrogen supply from cylinder banks or from a hydrogen generator, hydrogen sensors have been installed and are interlocked with the hydrogen gas supply.*
- *Two sensors are installed in every room for redundancy.*
- *Sensors installed at ceiling level where accumulation is most severe.*
- *H<sub>2</sub> sets off the alarm at 10% of Lower Flammability Limit (LFL).*
- *In rooms that use only bottled hydrogen, only a single cylinder is in the room at any given time and bottle sizes are limited to ensure being safely below the LFL of the room even with complete release of a full cylinder.*
- *Work has been reviewed and approved through Los Alamos National Lab's safety programs:*
  - *Hazard Control Plan (HCP) - Hazard based safety review*
  - *Integrated Work Document (IWD) - Task based safety review*
  - *Integrated Safety Management (ISM)*
