Project ID # **STP 40**

Overview (storage)

Timeline

- Start June 2006
- End May 2007

Budget

- \$825,000
 - \$660,000 (DOE)
 - \$165,000 (Purdue)
- Funding for FY06: expected

Barriers

- Barriers addressed
 - Cost of ammonia borane
 - Formation of harmful compounds in combustionbased methods
 - Thermal Management
- Targets storage system

		2007	2010	2015
Specific Energy	kgH ₂ /kg (wt%)	(4.5%)	(6%)	(9%)

Partners

- **General Motors**
- **General Atomics**

Overview (bio-production)

Timeline

- Start June 2006
- End May 2007

Budget

- \$415,500
 - \$330,000 (DOE)
 - \$85,500 (Purdue)
- Funding for FY06: expected

Barriers

- Barriers addressed
- Hydrogen production levels
- Gas Separation
- System Efficiency

Targets

	2006	2010	2015
Hydrogen Production	20	40	45+
percentage			

Partners

- Cargill
- Grifffith Labs
- Advanced Power Technologies
- Innovene

Objectives (storage)

- Examine the dehydrogenation of ammonia borane at lower temperatures
- New synthesis of ammonia borane to decrease the cost
- Develop a method for generating hydrogen from boron-hydrogen compounds with hydrogen yield >6 wt%, no catalyst and no harmful byproducts
- Design efficient thermal management subsystems to facilitate dehydrogenation and fastfilling processes

Objectives (bio-production)

- Provide a renewable energy source to further DOE goals for development of a hydrogen energy economy
- Use biological organisms to produce hydrogen from waste using anaerobic process
- Use solar energy to preprocess the feed material
- Produce electricity in remote locations with the produced hydrogen used in either a fuel cell or reciprocating engine
- Consider ways to produce fertilizer
- Possibly separate/sequester carbon dioxide by use of organometallic nano catalysis

Approach (storage)

 Mixtures of boron-hydrogen compounds with metal (Al or Mg) and gelled water, upon ignition, exhibit parallel reactions:

```
NaBH_4 + 2 H_2O \rightarrow NaBO_2 + 4 H_2
AI + 1.5 H_2O \rightarrow 0.5 AI_2O_3 + 1.5 H_2
```

$$NaBH_4 + 2 H_2O \rightarrow NaBO_2 + 4 H_2$$
 $Mg + H_2O \rightarrow MgO + H_2$

- The highly exothermic metal-water reaction assists hydrolysis of B-H compound, eliminating the need for catalyst.
- Water is an additional H₂ source.
- Solid byproducts are environmentally friendly materials.

Approach (storage)

- Reviewed heat transfer issues in on-board hydrogen storage technologies, including compressed H₂, LH₂, chemical hydrides and metal hydrides
 - Zhang et al., J. Heat Transfer, 127, pp1391 (2005).
- Studied SBH systems
 - Heat of reaction measurement
 - Kinetics measurement
 - Sub-scale (1-kW_e) system design, construction and tests
 - Sub-scale (1-kW_e) system modeling
- Investigating high-pressure metal hydride systems
 - Sub-scale (1/50) system design, construction and tests
 - Sub-scale (1/50) system modeling

Approach (bio-production)

- Preliminary laboratory studies have verified the feasibility to use anaerobic digestion of organic waste for the production of hydrogen
- Determine the biological, chemical, and physical parameters that influence hydrogen production levels and develop a scheme to optimize production.
 - Individual organism
 - Consortium of organisms
- Develop an energy model that integrates design considerations with the research process
 - Heat flow modeling
 - Biological processes
 - Preliminary bio reactor concepts
 - Overall energy balance

- Examined the transition-metal catalyzed dehydrogenation of ammonia borane in solution at lower temperatures
- Examined the transition-metal catalyzed alcoholysis and hydrolysis of ammonia borane
- Achieved several new syntheses of ammonia borane (and amine boranes) that should decrease the cost of ammonia borane

New Synthesis of Borane-Ammonia

$$B(OMe)_3 + LiAlH_4 + NH_4Cl$$
 \xrightarrow{THF} $BH_3NH_3 + Al(OMe)_3 + LiCl + H_2$

$$B(OMe)_3 + 4 LiH + NH_4Cl \frac{THF}{AlCl_3 8 hrs} BH_3NH_3 + Al(OMe)_3 + 4 LiCl + H_2$$

Comparison of Procedures for the Synthesis of BH₃NH₃

Existing Methods:

$$B(OMe)_3 \rightarrow NaBH_4 \rightarrow LiBH_4 \rightarrow BH_3NH_3$$

New Method: One-pot Reaction

$$B(OMe)_3 \rightarrow BH_3NH_3$$
 Yield: 86%, Purity: > 95%

Dehydrogenation of Borane-Ammonia

Other transition metal salts used: NiCl₂, CoCl₂, etc. Similar results were obtained with all other TM salts.

One-pot Synthesis and Dehydrogenation of Borane-Ammonia

3 LiBH₄ + 3NH₄Cl
$$\xrightarrow{\text{PdCl}_2}$$
 $\xrightarrow{\text{PdCl}_2}$ $\xrightarrow{\text{B}_3\text{N}_3\text{H}_6}$ + 3 LiCl + 9 H₂ THF, reflux 6 h

Other transition metal salts used: NiCl₂, CoCl₂, etc.

Similar results were obtained with all other TM salts.

Various other ammonium salts gave similar results.

- Mixtures of NaBH₄ with water, metal (Al or Mg) and additional minor ingredients (gellant, stabilizer) were developed.
- The developed mixtures exhibit stable combustion and 7 wt% H₂ yield, with safe solid byproducts.

Combustion of mixture

Example: NaBH₄: nanoAl: H₂O=1:2:3 (mass ratio). Sample diameter: 10 mm t = 10 s

t = 1 s

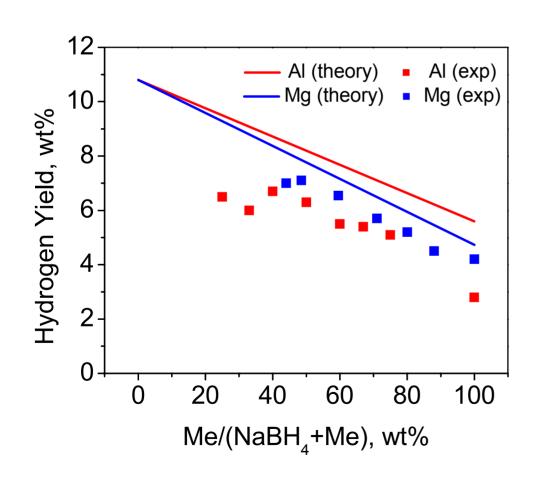

- The reaction wave propagates uniformly along the sample.
- The gaseous products flow in the reverse direction through the combustion products towards the open top end of the sample.

Technical Accomplishments (storage) Hydrogen generation

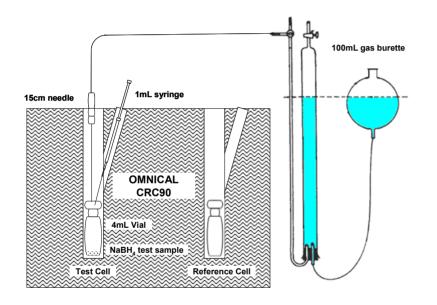

- Evolved gas: H₂ (>99%).
- Efficiency of H₂ generation:

Al 74-77% Mg 88-92%

The maximum observed H₂ yield is ~7 wt%.

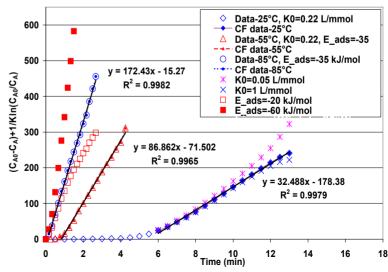

Heat of reaction (SBH)

- Widely cited: 75 kJ/molH₂
- This study: 52.5 kJ/molH₂

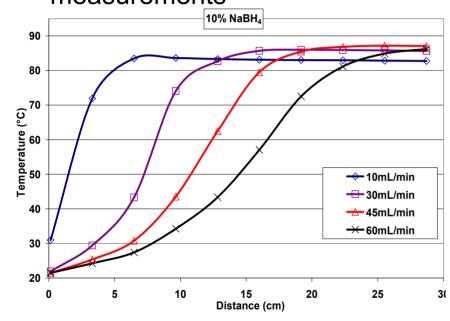

Kinetics (SBH)
 commercially available 3% Ru
 on 2mm carbon extrude

$$r_{SBH} = -A \exp\left(\frac{-E_a}{R_u T}\right) \frac{KC_{SBH}}{1 + KC_{SBH}}$$

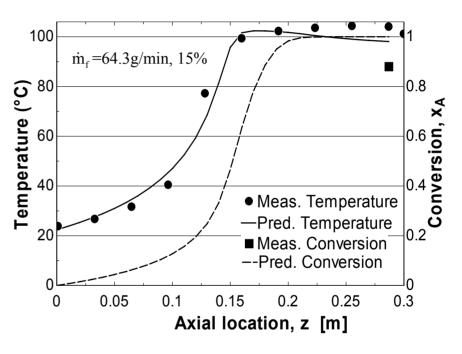

1-kW_e SBH reactor measurements

1-kW_e SBH reactor modeling

$$\rho u C_{p,eff} \frac{dT}{dx} = k_{eff} \frac{d^2T}{dx^2} - h_r^o \dot{\omega}_f M W_f - h_{fg} \dot{m}_v$$

High-pressure metal hydride sub-scale system modeling

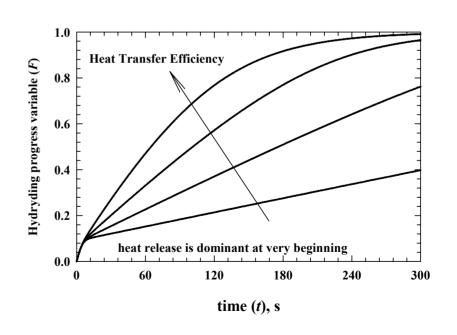

$$\rho C_p \frac{\partial T}{\partial t} = -\frac{[H]_m}{2} \Delta H_r \frac{\partial F}{\partial t} + \lambda_{eff} \nabla^2 T$$

$$F = \frac{x}{x_m} \qquad \qquad x = \frac{[H]}{[M]}$$

$$\frac{\partial F}{\partial t} = k(1 - F)$$

$$k = C_a \exp\left(-\frac{E_a}{R_u T}\right) \ln \frac{P}{P_{eq}}$$

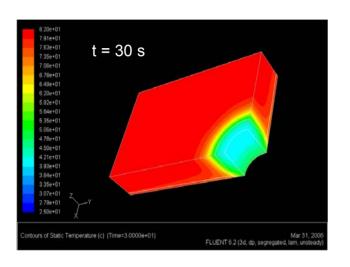

$$P_{eq} = P_o \exp \left[\frac{\Delta H_r}{R_u} \left(\frac{1}{T} - \frac{1}{T_o} \right) \right]$$

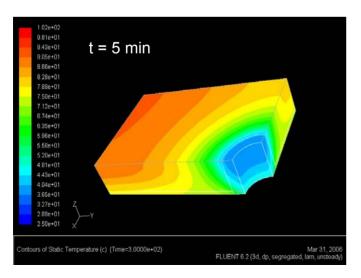

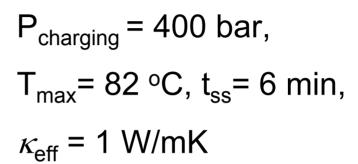

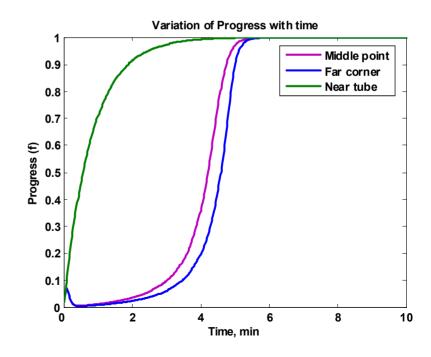

High pressure metal hydride sub-scale system modeling (3D)

Technical Accomplishments (bio-production)

Preliminary laboratory studies have verified the feasibility to use anaerobic digestion of organic waste for the production of hydrogen

Vial #	Treatmen t	Initial pH	Final pH	H ₂ (µmol)	Digestion fraction

40	Inoc, Boil	6.8	6.19	9144.62	.469
43	Inoc, Boil	6.8	6.16	6706.92	.372
21	Uninoc	6.8	6.5	0	.250
41	Uninoc	5.8	5.74	0	.245

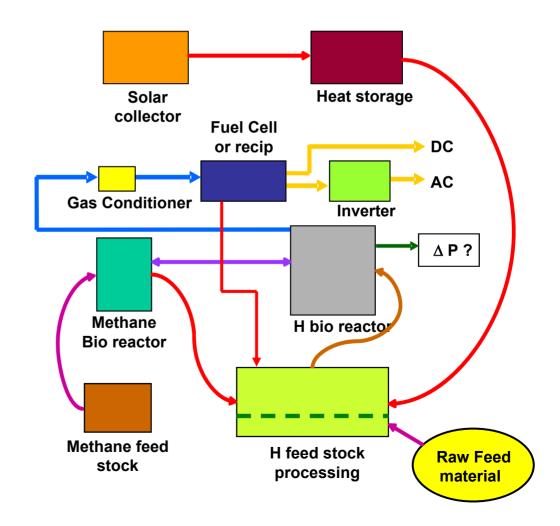

Note: Inoc = inoculated with anaerobic waste water treatment effluent

> Boil = boiled for 10 minutes before start Uninoc = not inoculated

Technical Accomplishments (bio-production)

- An initial computer simulation model of the proposed system has been developed
- Model will be used to consider possible design and process alternatives as well as means to optimize the process

Future Work (storage)

- New formulation of ammonia-borane (AB) doped with transition metal salts
- Thermolysis of AB in the presence of water vapor
- Thermal management for AB systems
 - Thermo-chemical property measurements
 - Hydrogen generator and AB regenerator modeling
 - Sub-scale hydrogen generator and AB regenerator tests

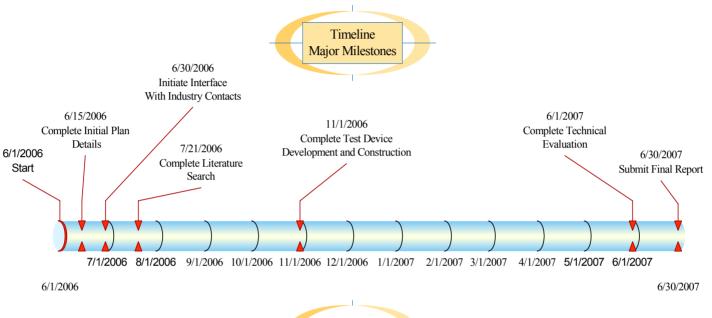

Future Work (storage)

- Insight into combustion mechanisms of B-H compounds mixed with metals and water.
- Optimization of mixture compositions and process conditions
- Focus on ammonia borane, with the goal to further increase hydrogen yield
- Design and construction of power system demonstration unit

Future Work (bio-production)

ID	Task Name	Start	Finish	Duration	2006 Jun Jul Aug Sep Oct Nov Dec	2007 Jan Feb Mar Apr May Jun
1	Develop Initial Plan Details	6/1/2006	6/15/2006	11 d		
2	Conduct Literature Search	6/8/2006	7/21/2006	32d		
3	Establish Interface With Industry Contacts	6/30/2006	9/29/2006	66d		
4	Construct Test Device	7/3/2006	11/1/2006	88d		
5	Conduct Evaluation of Innoculum and Conditions to Maximize H Production	6/15/2006	6/1/2007	252d		
6	Conduct Energy Evaluation	11/1/2006	6/1/2007	153d		
7	Prepare Final Report	4/17/2007	6/29/2007	54d		

Summary (storage)

- All on-board hydrogen storage technologies involves heat transfer challenges
- Unknown thermo-physical properties need to be measured or modeled
- Designs of reactors and other components need to be tested and modeled at appropriate sub-scales
- Mixtures of boron-hydrogen compounds with metal and water can be used for hydrogen generation by combustion
 - high specific energy
 - no catalyst for H₂ generation
 - safe reaction byproducts, which can be recycled

Summary (bio-production)

- Anaerobic production of hydrogen holds promise as a viable source of energy
- Waste streams provide a low cost source of feed for the energy production process
- Initially this approach holds promise to provide an environmentally friendly means to produce electricity in remote or third world applications
- As the technology is developed there is the opportunity to scale up the size of the energy production
