## The Effect of Airborne Contaminants on Fuel Cell Performance and Durability

Jean St-Pierre (PI)

University of Hawaii – Manoa, Hawaii Natural Energy

Institute

May 16, 2012

Project ID # FC065

This presentation does not contain any proprietary, confidential, or otherwise restricted information

# Overview

#### Timeline

- Project start date: April 1, 2010
- Project end date: March 31, 2014
- Percent complete: 50 %

#### Budget

- Total project funding
  - DOE share: \$3,649,116
  - Cost share: \$917,762
- Funding received in FY11: \$436,408
- Planned funding for FY12: \$400,000

#### Barriers

- Durability
  - 5000 cycling h by 2015 (automotive system)
- Performance
  - 50 % energy efficiency at rated power (automotive system)

#### Partners

- Interactions/collaborations: University of Connecticut, Center for Clean Energy Engineering (subcontractor), UTC Power (subcontractor), Ballard Power Systems (subcontractor)
- Project lead: Jean St-Pierre

# **Relevance - Objectives**

- Identification and mitigation of the airborne contaminants adversely impacting system
   performance and durability
  - Filtering system component specification input
  - Fuel cell stack material, design, operation or maintenance changes to recover performance losses

	Technical Targets for Automotive Applications: 80-kWe (net) Integrated Transportation Fuel Cell Power Systems Operating on Direct Hydrogen										
	Characteristic	Units	2003 Status	2005 Status	2010	2015					
	Energy efficiency @ 25% of rated power	%	59	59	60	60					
	Energy efficiency @ rated power	%	50	50	50	50					
	Power density	W/L	440	500	650	650					
	Specific power	W / kg	420	470	650	650					
₹	Cost	\$ / kWe	200	110	45	30					
	Transient response (time from 10% to 90% of rated power)	seconds	3	1.5	1	1					
Project argets	Cold start-up time to 50% of rated power @-20°C ambient temp @+20°C ambient temp	seconds seconds	120 60	20 <10	30 5	30 5					
	Start up and shut down energy from -20°C ambient temp from +20°C ambient temp	MJ MJ	N/A N/A	7.5 N/A	5 1	5 1					
	Durability with cycling	hours	N/A	~1,000	5,000	5,000					
	Unassisted start from low temperatures	°C	N/A	-20	-40	-40					

# **Relevance - Objectives**

- Task I Contaminant studies
  - Identification of the worst contaminants leading to a significant loss with fuel cell tests
  - Mechanism determination by in situ tests and ex situ tests
    - A segmented cell, product stream and water analyses, residence time distribution measurements, and fingerprinting with a generic model library were either seldom or not previously used

A United Technologies Company

- Task 2 Real world operation and mitigation strategies
  - Potential changes, fluid circulation and other strategies derived from contamination mechanisms
  - Compatibility with fuel cell system constraints and effectiveness over long operation periods
- Task 3 Model development and application
  - Generic model library expansion with identified gaps in contamination mechanisms
- Task 4 Outreach
  - Patents, publications, presentations

# **Relevance - Objectives**

• Detailed project objectives for the relevant reporting period include:

Tas	k	Objectives	]
1.1	Impurity Identification and Screening	<ul> <li>Identify potential contaminants originating from air pollution and road side environments.</li> <li>Screen and prioritize impurities based on degradation of cell performance or chemical interaction with the MEA.</li> </ul>	
1.2 (	Contaminant Impact	• Quantify impact of contaminant and contaminant mixtures on fuel cell performance and durability at different operating conditions.	
		<ul> <li>Quantify all reaction products to aid identification of reaction and adsorption processes.</li> <li>Quantify spatial variability of contaminant processes using segmented cell.</li> </ul>	
1.3	Cell Recovery	Quantify cell recovery resulting from removal of contaminant and change of operating conditions.	$\sim$
1.4	Ex-situ Analysis	• Characterize changes in catalyst, MEA and GDL structure resulting from exposure to contaminant and contaminant mixtures.	March 2011
2.1 Real World Operation		Characterize effect of contaminant at 'real world' operating conditions.	lO
2.2 Mitigation Strategies		• Explore operating strategies and novel techniques to mitigate contaminant effects.	March 2012
3.0	M. LID. J	• Validate and use empirical performance models to quantify and understand spatial variability of contaminant effects in PEMFCs.	objectives
	Model Development and Application	• Develop and validate mechanistic models that quantify material degradation.	
	and Application	• Establish the relationship between those mechanisms and models, and the loss of PEMFC performance.	[/
4.0	Outreach	• Conduct outreach activities to disseminate critical data, findings, models, and relationships that describe the effects of airborne contaminants on PEMFC performance and durability.	

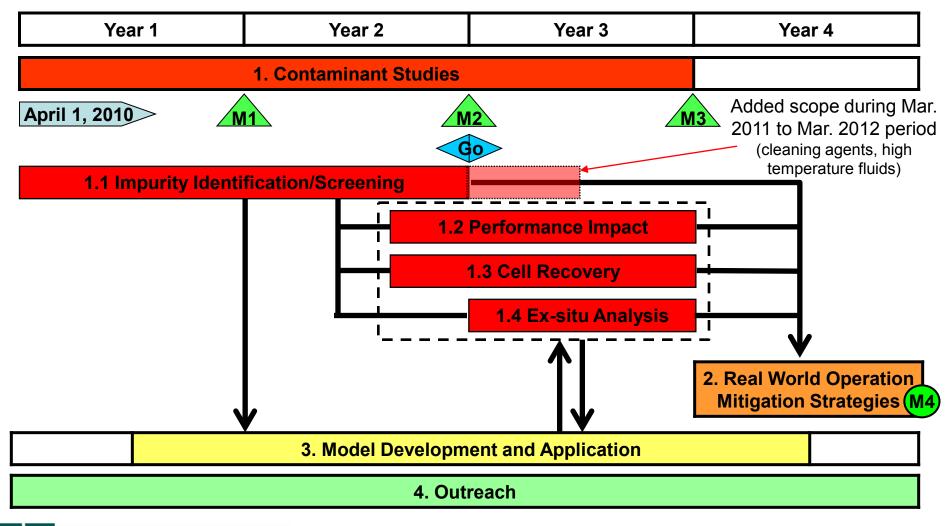

BAL

# Approach - High Level Plan

## Approach - Significant Decisions Points

- Milestones at the end of each project year
  - M1 (<u>completed</u>): Prioritize a group of ~10 airborne contaminants of relevance to stationary and automotive fuel cell applications based on
    - Their performance impact (screening results)
    - Occurrence (literature results, industry exchange)
  - M2 (<u>March 31, 2012</u>): Quantify performance loss for at least 4 different contaminants under various operating conditions
  - M3: Quantify spatial variability of performance loss for at least 4 different contaminants.
     Identify principal poisoning mechanism for same
  - M4: Demonstrate successful mitigation of the impact of the most important 4 airborne contaminants
- Go/No go decision criteria at the end of the second project year
  - G1 (<u>March 31, 2012</u>): Identified contaminants (and concentrations) resulting in performance loss ≥ 20 % of initial performance loss
  - G2 (<u>March 31, 2012</u>): Effects of various conditions on cell poisoning quantified. Data reported to modelers
  - G3 (<u>March 31, 2012</u>): Mitigation strategies, restoring cell to 90 % of initial performance, identified for reversible contaminants

# Approach – High Level Plan

- Institution dependent contaminant focus
  - Foreign cations (originating from salts in marine environments, for example) and road side contaminants (C2E2)
  - Airborne contaminants (HNEI)
- Approach minimizes need for time consuming benchmarking activities
  - Benchmarking already completed (USFCC and a DOE project activities)
  - Different setup designs are needed for each group
    - Foreign cations and road side contaminants require liquid or solid injection
    - Airborne contaminants require gas injection
- The project ensures the widest range in contaminant sources is studied
  - "Effect of System and Air Contaminants on PEMFC Performance and Durability" project (ID # FC048) focuses on system sources
    - Duplication is avoided because the PI is a team member
  - Fuel cell contaminants were studied in previous DOE projects (ID # FC045, FC046, FC047)
    - Contaminants are not duplicated or are studied at the cathode rather than the anode

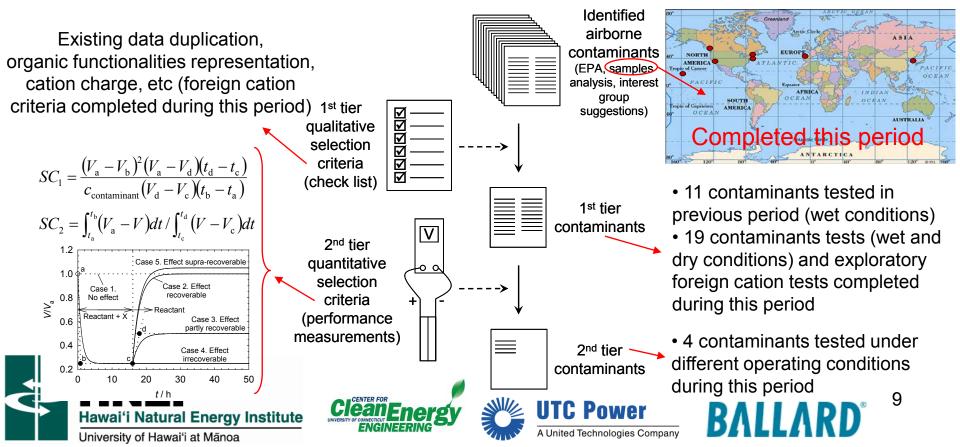

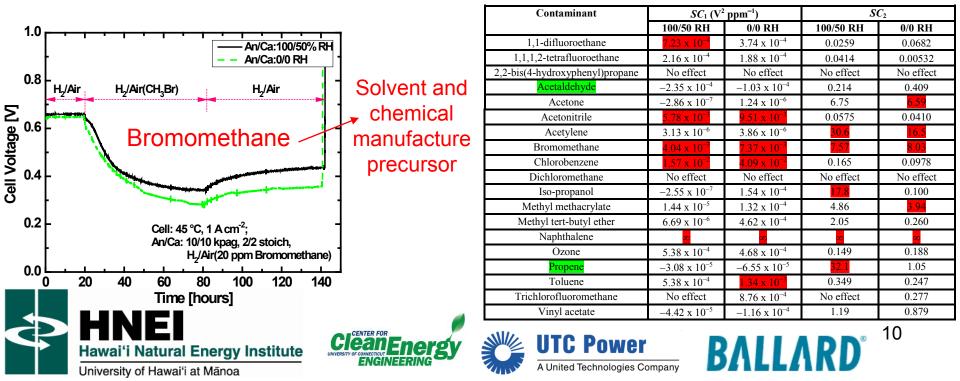

- 4 deleterious contaminants and corresponding concentrations leading to a 20 % fuel cell performance loss identified (M2, G1-3)
  - Input for filter system component specifications definition

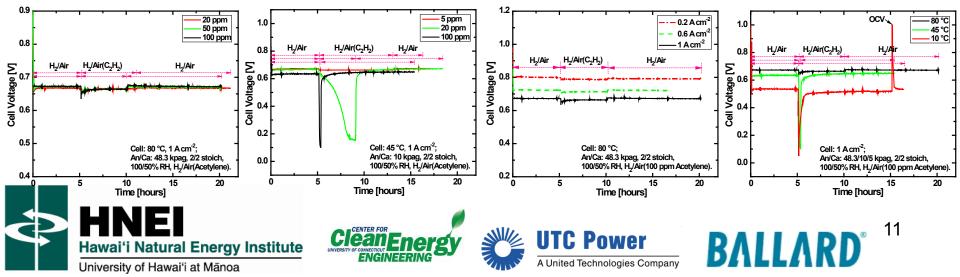

#### Accomplishments and Progress – Task 1 Contaminant Studies (Inorganic and Organic)

- 1<sup>st</sup> tier contaminants tests completed during this period (March 2011 to March 2012)
- $SC_2$  identified as preferable during this period  $(SC_2 = \int_{t_1}^{t_b} (V_a V) dt / \int_{t_1}^{t_d} (V V_c) dt)$ 
  - Sensitive to contaminants, "beneficial" species but much less to operating conditions
- 2<sup>nd</sup> tier contaminants selected during this period
  - Acetylene, bromomethane, iso-propanol, methyl methacrylate, naphthalene, propene
    - Representative of alkenes, alkynes, alcohols, esters, halogenated hydrocarbons and aromatics

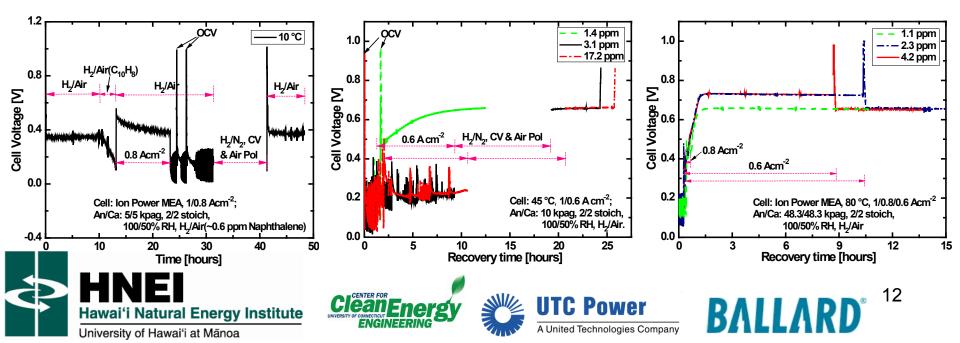

#### Accomplishments and Progress – Task 1 Contaminant Studies (Operating Condition Effects)

- 4 2<sup>nd</sup> tier contaminants tested under different operating conditions during this period (March 2011 to March 2012)
  - Acetylene data appear below (others are in the technical backup slides section)
- Effect of operating conditions on acetylene contamination determined
  - Higher concentrations are worse
    - >100 ppm for a 20 % performance loss at 80 °C
    - ~16 ppm for a 20 % performance loss at 45 °C
  - Higher current densities are worse
  - Lower temperatures are worse

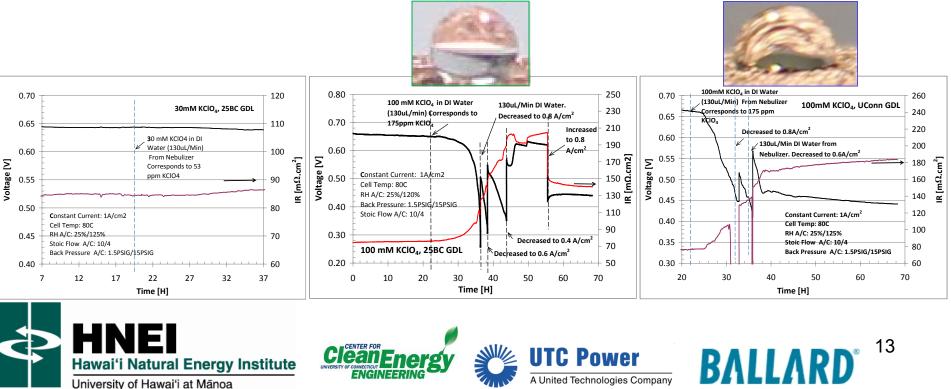

- For all 4 2<sup>nd</sup> tier contaminants tested
  - More than 90 % of the voltage loss at steady state is recovered after contaminant injection interruption with the exception of naphthalene for some operating conditions
  - Operation condition changes were sufficient to recover performance after naphthalene exposure
    - Recovery is more difficult at low temperatures and higher concentrations

### Accomplishments and Progress – Task 1 Contaminant Studies (Foreign Cations)

- 1<sup>st</sup> tier foreign cation contaminants identified during this period
   K<sup>+</sup>, Ba<sup>+2</sup>, Ca<sup>+2</sup>, Al<sup>+3</sup>
- Exploratory foreign cation tests completed during this period
  - A higher contaminant concentration and a more hydrophilic gas diffusion layer increase the degradation rate

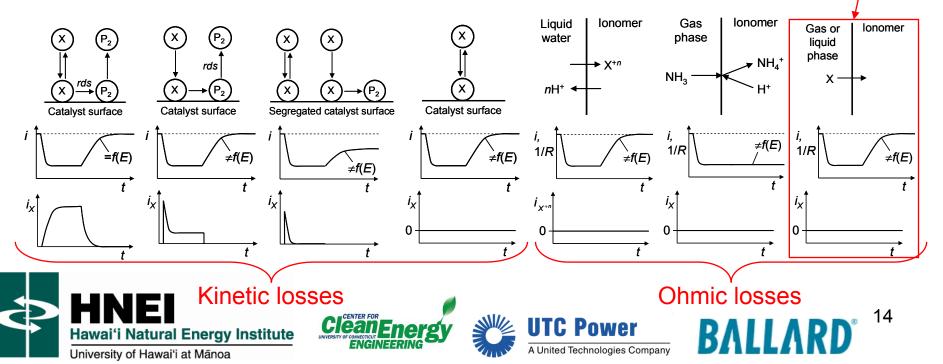

# Accomplishments and Progress – Task 3 Model Development and Application

Completed

this

period

- A library of widely applicable generic models is planned to
  - Ease identification of mechanisms (fingerprint characteristics)
    - Practical approach because few mechanisms were identified
  - Facilitate cell performance predictions and the definition of tolerance limits
    - Explicit expressions for concentration dependent steady state and time constants
- The model library will be expanded
  - 4 cases initially planned with 3 incomplete cases related to mass transport losses

# Collaborations

- HNEI (prime university organization)
  - All tasks with a focus on airborne contaminants
    - Contaminant studies, real world operation and mitigation strategies, model development and application, outreach
- C2E2 (university sub-contractor)
  - All tasks with a focus on foreign cations and roadside contaminants
    - Contaminant studies, real world operation and mitigation strategies, model development and application, outreach
- UTC Power (industry sub-contractor)
  - Contaminant identification and test protocols development support, experimental data and analysis review, SEM/TEM analysis
- Ballard Power Systems (industry sub-contractor)
  - Contaminant identification and test protocols development support, experimental data and analysis review

## Collaborations

- Provided to Nuvera
  - Air filter specification definition support
- GM provided
  - Nebulizer design and integration support
  - Heating tube for contaminant evaporation (for example, naphthalene)
  - Membrane contamination by a chemically and electrochemically inactive species model support and validation data
- GM, Nuvera and UTC Power provided
  - Air filters
- Frequent interactions with the "Effect of system and air contaminants on PEMFC performance and durability" project team (ID # FC048)
  - Mutual support including activities overlap avoidance
- DOE durability working group
- Requested 1<sup>st</sup> tier contaminants validation by an interest group that includes
  - LANL, NREL, ANL, FCHEA, NRL, SAE, NIST, Praxair, Air Liquide, Air Products, CaFCP, CaSFCC, EPA, NCAR, Nuvera, CaARB, AFCC, NASA, JARI
    - Information received does not require any project plan change
- Treadstone Technologies will supply
  - Metallic bipolar plates to investigate interactions with contaminants

# **Proposed Future Work**

- Fiscal year 2012
  - Milestone 2 and go/no go decisions 1 to 3 (March 31, 2012)
  - Complete 1<sup>st</sup> tier foreign cation screening tests (task 1.1) and 2<sup>nd</sup> tier foreign cation impact (task 1.2) and cell recovery (task 1.3) tests
  - Complete added contaminant identification and screening (task 1.1) scope
    - Cleaning agents and high temperature fluids
  - Initiate activities supporting mechanism determination for 2<sup>nd</sup> tier contaminants using in situ (task 1.2) and ex situ data (task 1.4), and generic model library
  - Develop models for the impact of liquid water on contaminant scavenging and for a contaminant supply limitation (task 3)
- Fiscal year 2013
  - Investigate interactions between contaminants and metallic bipolar plates (task 1.2)
  - Develop a model for the uneven ionomer proton distribution in the presence of a foreign cation (task 3)
  - M3: Quantify spatial variability of performance loss for at least 4 different contaminants.
     Identify principal poisoning mechanism for same

Summary

- Performance and durability impacts are mitigated by providing input into filtering system component specification and fuel cell material selection, design, operation or maintenance
- Approach •

•

- Document in situ contaminant-concentration-dependent effects
- Determine contamination mechanisms with extensive in situ and ex situ measurements, and generic model library
- Develop mitigation strategies based on potential changes, fluid circulation and mechanisms
- Technical accomplishments and progress •
  - Two-tiered contaminant down-selection approach
  - Performance losses for 4 2<sup>nd</sup> tier contaminants with varying operating conditions
  - Membrane contamination by an inactive contaminant model
- Collaborations ٠
  - Multi-faceted interactions with team organizations, project team ID # FC048, consumers, suppliers, the DOE durability working group and an interest group including fuel cell industries add relevance to activities
- Proposed future work
  - Complete in situ and ex situ characterization tests, and several generic models to support the identification of mechanisms for 2<sup>nd</sup> tier contaminants

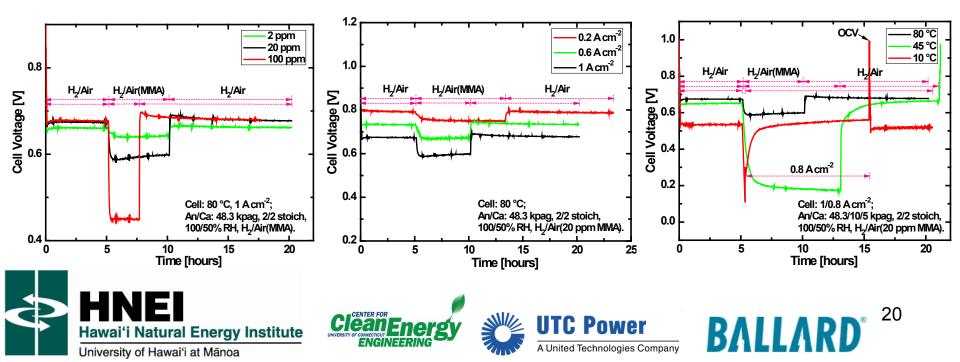

## **Technical Backup Slides**

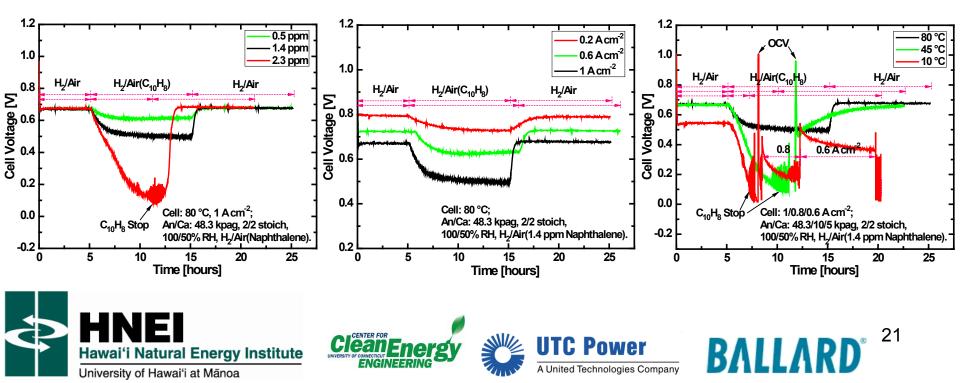

19

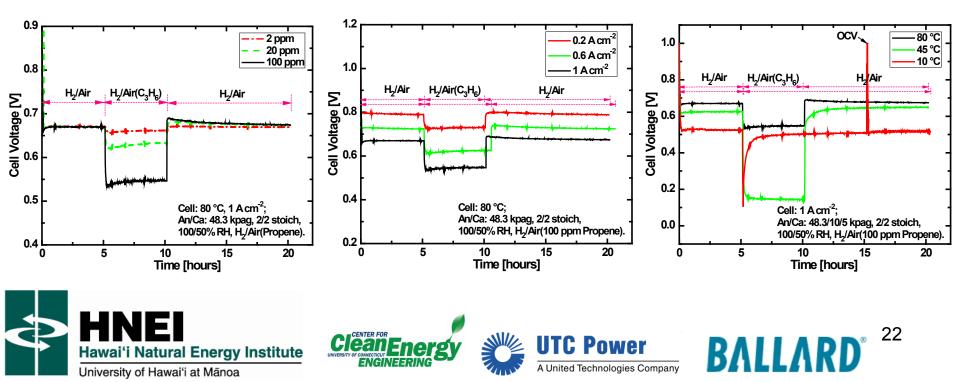

- Effect of operating conditions on methyl methacrylate contamination determined
  - Higher concentrations are worse
    - ~20 ppm for a 20 % performance loss
  - Higher current densities are worse
  - Lower temperatures are worse

- Effect of operating conditions on naphthalene contamination determined
  - Higher concentrations are worse
    - ~1.4 ppm for a 20 % performance loss
  - Higher current densities are worse
  - Lower temperatures are worse

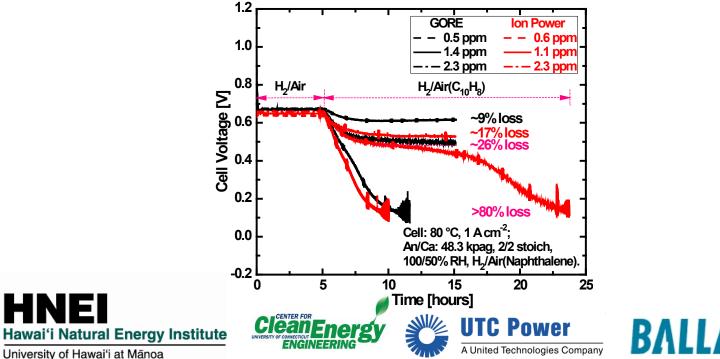

- Effect of operating conditions on propene contamination determined
  - Higher concentrations are worse
    - ~100 ppm for a 20 % performance loss
  - Higher current densities are worse
  - Lower temperatures are worse

- Initially planned to use Ion Power membrane/electrode assemblies
  - Only supplier willing to supply materials for ex situ studies (catalyst, ionomer, etc)
- Later shift to Gore<sup>®</sup> membrane/electrode assemblies provided an opportunity to compare the effect of different designs on naphthalene contamination
  - Ion Power membrane/electrode assemblies performance too variable
  - Similarities include catalyst (supported Pt), cathode catalyst loading (~0.4 mg/cm<sup>2</sup>), ionomer (Nafion<sup>®</sup>) and gas diffusion layer (SGL 25 BC)

23

- An effect was observed but the cause remains to be determined

## **Draft Milestone 3 Plan**

		2012									2013
