Basic Energy Sciences Mission

To understand, predict, and ultimately control matter and energy at the electronic, atomic, and molecular levels

BES fulfills its mission through:

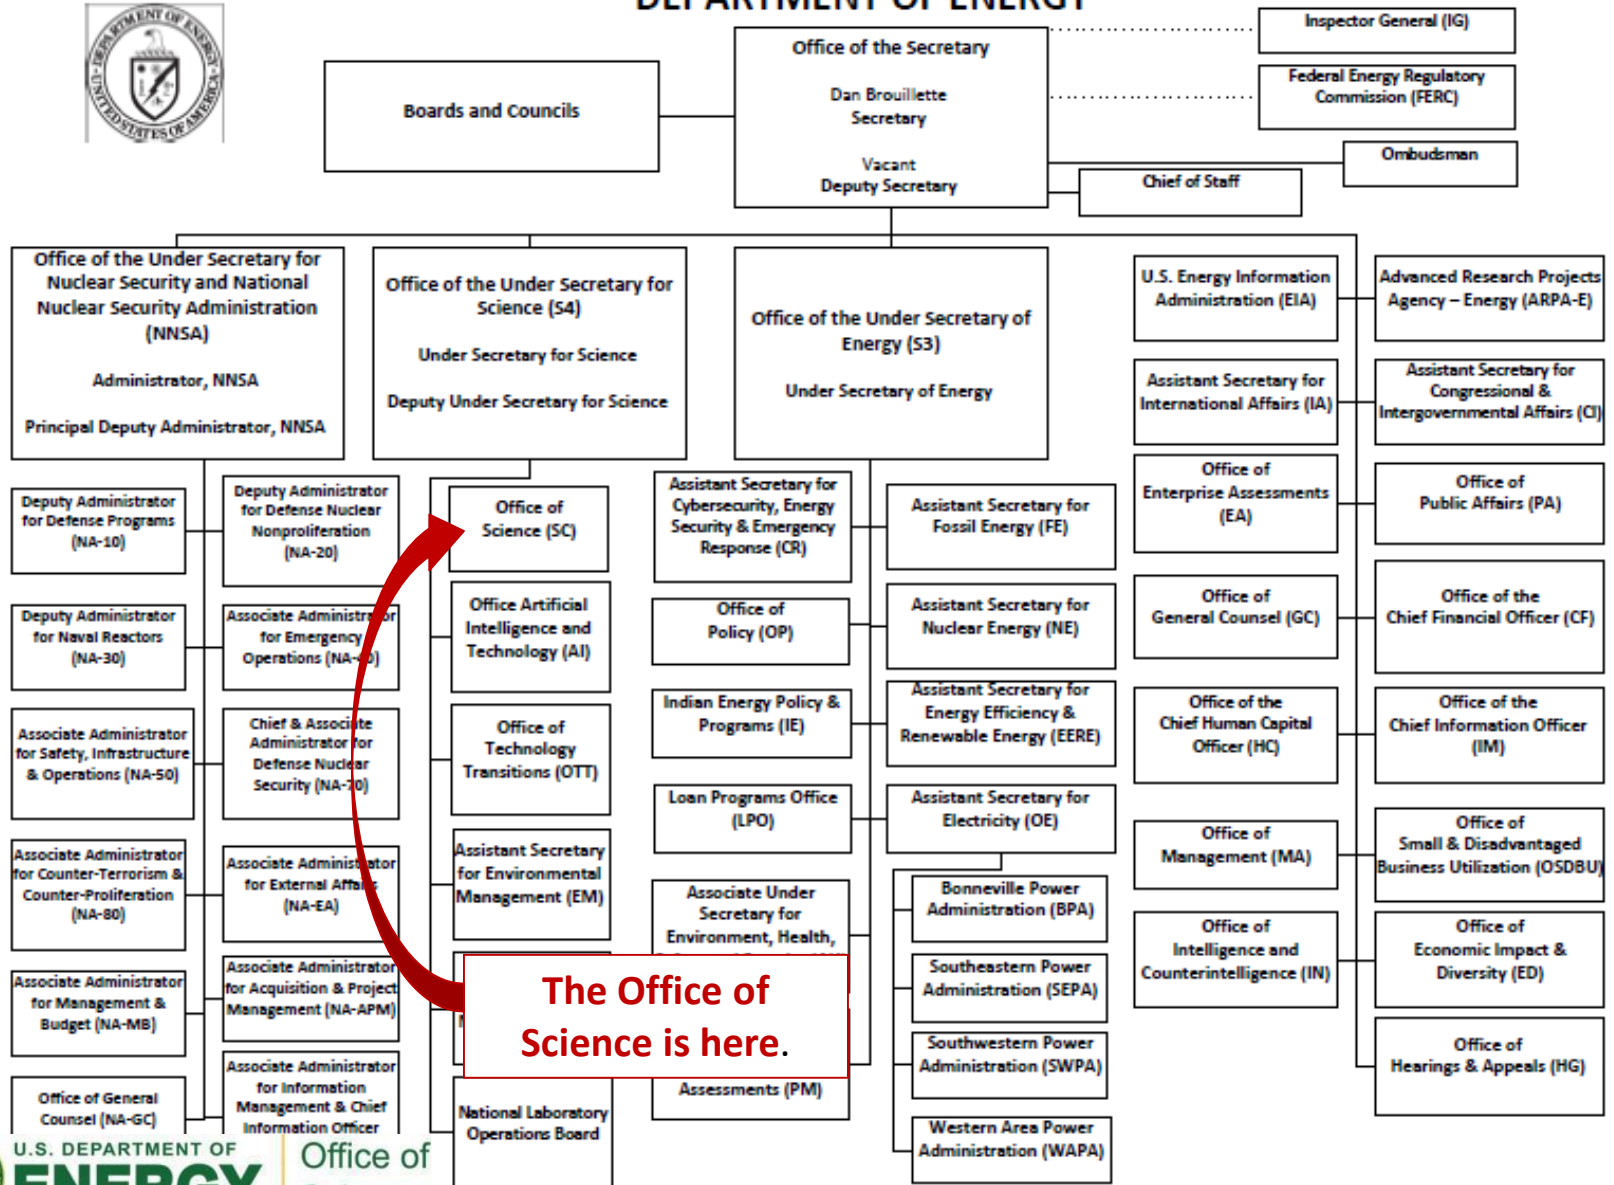

- Supporting **basic research** to discover new materials and design new chemical processes that underpin a broad range of energy technologies
- Operating **world-class scientific user facilities** in x-ray, neutron, and electron beam scattering as well as in nanoscale research
- Managing **construction and upgrade projects** to maintain world-leading scientific user facilities

DOE Office of Basic Energy Sciences: Scientific User Facilities

More than 16,000 users in FY 2019

- ★ Available to all researchers at no cost for non-proprietary research, regardless of affiliation, nationality, or source of research support
- ★ Access based on external peer merit review of brief proposals
- ★ Coordinated access to co-located facilities to accelerate research cycles
- ★ Collaboration with facility scientists an optional potential benefit
- ★ Instrument and technique workshops offered periodically
- ★ A variety of on-line, on-site, and hands-on training available
- ★ Proprietary research may be performed at full-cost recovery

Neutron Sources

- High Flux Isotope Reactor (ORNL)
- Spallation Neutron Source (ORNL)

Nanoscale Science Research Centers

- Center for Functional Nanomaterials (BNL)
- Center for Integrated Nanotechnologies (SNL & LANL)
- Center for Nanophase Materials Sciences (ORNL)
- Center for Nanoscale Materials (ANL)
- Molecular Foundry (LBNL)

Light Sources

- Advanced Light Source (LBNL)
- Advanced Photon Source (ANL)
- Linac Coherent Light Source (SLAC)
- National Synchrotron Light Source-II (BNL)
- Stanford Synchrotron Radiation Laboratory (SLAC)

BES Research and Funding Modalities: Informed by Community-Based Strategic Planning

- 
- **Core Research (>1,300 projects, ~\$600M/yr)**
Single investigators (\$150K/year) and small groups (\$500K-\$2M/year) engage in fundamental research related to any of the BES core research activities. Investigators propose topics of their choosing.
 - **Computational Materials & Chemical Sciences (\$26M/yr)**
Core awards are \$2-4M/year research activities for 4-year terms; focus on delivering open-source software for materials and chemistry by design in preparation for exascale computing.
 - **Energy Frontier Research Centers (46, \$115M/yr)**
\$2-4M/year research centers for 4-year award terms; focus on fundamental research described in the Basic Research Needs Workshop reports.
 - **Energy Innovation Hubs (\$39M/yr)**
Research centers for 5-year award terms, established in 2010 (\$15-25M/year), engage in research topics that have proven challenging for traditional funding modalities and in which success could be transformative to science and technology. Project goals, milestones, and management structure are a significant part of the proposed Hub plan.

Energy Frontier Research Centers (2009 – 2019)

EFRC AWARDS HISTORY

46.

Initial awards totaling \$777 million, including 16 projects funded by the American Recovery and Reinvestment Act.

32.

Awards totaling \$400 million in an open recompetition in which 22 existing EFRCs were renewed.

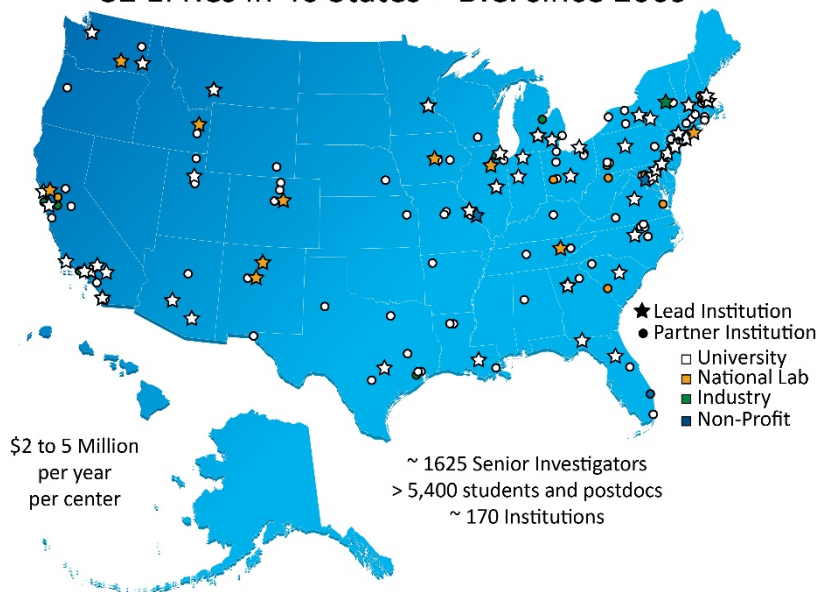

4.

Awards totaling \$40 million to accelerate scientific breakthroughs for DOE's mission in nuclear cleanup.

42.

Awards totaling \$380 million in an open recompetition, including nine 4-year renewals and eleven 2-year extensions of existing EFRCs.

82 EFRCs in 40 States + D.C. since 2009

Cumulative Investment (2009 – 2019): \$1.4B

Cumulative Accomplishments (Aug 2009 – May 2019)

- ❑ Over 11,600 peer-reviewed scientific publications
- ❑ ~110 companies have benefited from EFRC research
- ❑ Over 770 disclosures, 610 U.S. patent applications, and 480 foreign patent applications
- ❑ Over 210 patents issued
- ❑ Over 1,600 senior investigators at ~170 institutions (university, lab, industry, non-profit)
- ❑ At least 5,400 students and postdocs trained in EFRCs

Hydrogen and Fuel Cell Underpinning Science and Coordination

- BES support for fundamental research underpinning fuel cells and hydrogen has remained steady between \$20M and \$25M for several years.
- Research topics include science related to hydrogen storage, catalysts, membranes/ separations, bio-inspired and solar hydrogen production
- Annual solicitations applicable for basic research in these areas are in the “open” annual SC FOA and Early Career Research Program FOA. The Energy Frontier Research Center Program also includes these topics.
- BES coordinates with other DOE Offices through the internal working group, and with other government agencies through participation in the Interagency Working Group
- The core of BES strategic planning is “Basic Research Needs” workshops and roundtables, such as the 2017 Catalysis Science workshop (report on the BES web site)

Strategic Planning Workshops and Roundtables Provide Insights on Priority Research Areas

- Quantum Science

Theory, Modeling and Computation

- Characterization

Synthesis

- Cross-Cutting Energy

Basic Energy Sciences – FY 2021 Priorities

- **Critical materials (+\$25M)** - advance our understanding of fundamental properties of these materials, identify methodologies to reduce their use and to discover substitutes, and enhance chemical processing and separation science for rare earths
- **AI/ML (+\$10M)** - accelerate fundamental research for the discovery of new chemical mechanisms and material systems with exceptional properties and function
- **Polymer upcycling (+\$8.25M)** - provide the foundational knowledge for designing chemical components and processes that enable efficient conversion of plastic waste to high-value chemicals, fuels, and materials; investments informed by BES Roundtable on Chemical Upcycling of Polymers
- **Next-generation biology (+\$3.75M)** - cross-fertilize and leverage discoveries and approaches across the biological, physical, and computational sciences to develop bio-inspired, biohybrid and biomimetic systems; emphasis on neuromorphic computing, programmable biomaterials and biocatalysts, and tools for characterization of chemical, biological, biomaterial, and biohybrid systems

Critical materials: Peculiar outer-sphere water coordination of trivalent lanthanide complexes is shown to correlate with the lanthanide selectivity

Polymer upcycling: A circular polymer lifecycle would make it easy to recycle polyethylene terephthalate (PET)

Next-gen biology: Z-scheme solar water splitting via self-assembly of photosystem I-catalyst hybrids in thylakoid membranes

Basic Energy Sciences – FY 2021 Priorities

- **Microelectronics (+\$25M)** - focus on materials, chemistry, and fundamental device science; multi-disciplinary research to accelerate the advancement of microelectronic technologies in a co-design innovation ecosystem in which materials, chemistries, devices, systems, architectures, algorithms, and software are developed in a closely integrated fashion
- **Quantum information science** – investments in core research and the interdisciplinary SC QIS Center(s) started in FY 2020 are maintained at \$72M
- **Exascale computing** – investments in Computational Chemical and Materials Sciences are maintained at \$26M

Microelectronics: A cross-bar circuit element designed for future low power, non-volatile memory or neuromorphic computing applications.

QIS: Coordination compounds as qubits

Preparing for Exascale: Computational modeling of the motion of spherical (blue) and cylindrical (orange) nanoparticles in a solvent

Research Highlights

- Highlights are a representative of research across BES that can impact hydrogen and fuel cell technologies
- These illustrate the broad underpinning research supported by BES
- It is common for BES research awards to advance science that can impact an array of technologies.

Tuning Catalytic Bias of Hydrogen Gas Producing Hydrogenases

Catalytic H₂ evolution by [FeFe]-hydrogenase. Inner: Structure of [FeFe]-hydrogenase I from *Clostridium pasteurianum*, which includes an arrangement of electron transfer center and active-site hydrogen cluster (red circle) for the interconversion of H₂ from 2e⁻ and 2H⁺ (red arrows). Differences in the electrostatic environment at the active site tune the relative stability of key intermediates, changing the relative propensity to oxidize (outer cycle, clockwise direction) — or produce hydrogen (inner cycle, counter-clockwise direction).

Scientific Achievement

Developed a simple, yet elegant model that explains how [FeFe]-hydrogenases tune the tendency to oxidize or produce molecular hydrogen (catalytic bias).

Significance and Impact

This work provides a blueprint for engineering catalytic bias in synthetic oxidation-reduction catalysts.

Research Details

- Three [FeFe]-hydrogenases with the same cofactor active site show catalytic bias differences over six orders of magnitude.
- This work elucidated structure-activity relationships using a combination of electron paramagnetic resonance, infrared spectroscopy, X-ray powder diffraction, X-ray damage-free data from the Linac Coherent Light Source, electrochemistry, enzymatic assays, and computational methods.
- Results support a unifying model based on the relative stability of oxidation states and speciation as a function of reduction potential.

Ru^{δ+}–Ce³⁺ Interactions for Enhanced Dry Reforming of Methane

Scientific Achievement

Discovered a Ru/CeO₂ catalyst with good performance and stability in the Dry Reforming of Methane (DRM) reaction to produce syngas CO + H₂ from CO₂ + CH₄ and elucidated Ru^{δ+}–Ce³⁺ interaction of Ru nanoclusters (<1nm) as key.

Significance and Impact

DRM is desirable to utilize mixed sources of methane and CO₂ but requires high temperature with challenges of catalyst stability. In-situ studies of Ru/CeO₂ found Ru^{δ+}–Ce³⁺ interactions at cluster interfaces selectively activate C-H bonds, stabilize small clusters in reaction conditions and correlate with oxygen transfer for oxidation of surface carbon to resist coking. Small metal particle size and tuning metal–oxide interactions are important for improved DRM catalysts.

Research Details

- A 0.5wt% Ru–CeO₂ catalyst activated methane at temperatures as low as 150 °C.
- In-situ XAFS, AP-XPS and XRD show charged Ru clusters stabilized by reduced ceria (Ru^{δ+}–CeO_{2-x})
- Excellent activity/stability from stable small (<1nm) Ru clusters and improved oxygen mobility produced by metal–support interactions.

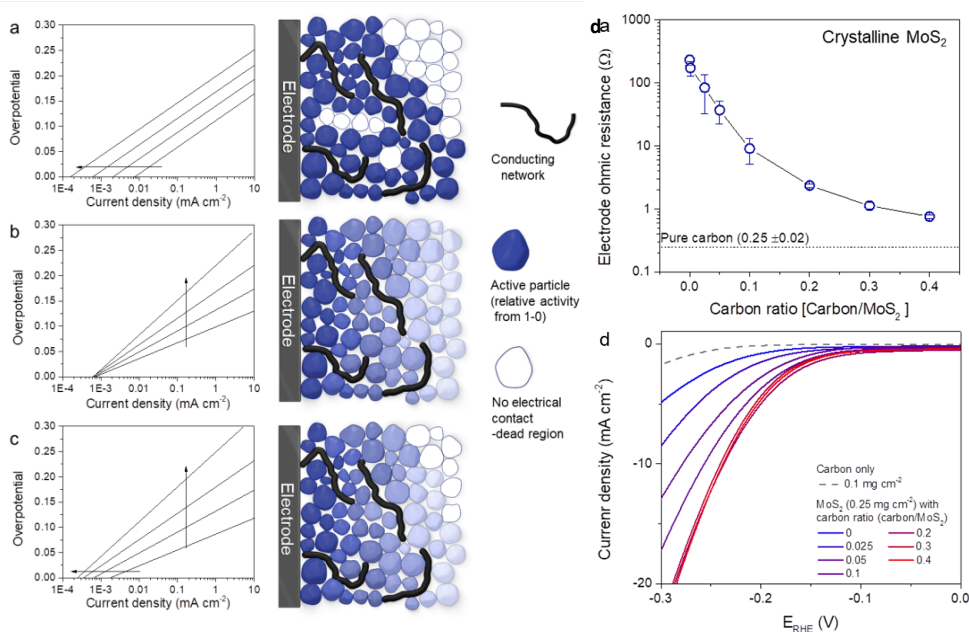

Z. Liu, F. Zhang, R. Ning, L. Lin, L.E. Betancourt, D. Su, W. Xu, J. Cen, K. Attenkofer, H. Idriss, J.A. Rodriguez, S.D. Senanayake
ACS Catalysis, 9(4) (2019) 3349-3359.

Ru^{δ+}–CeO_{2-x} interactions (top) stabilize and activate Ru clusters and improve oxygen mobility. Ru clusters on ceria imaged by EDX (right).

Poorly Conductive Electrochemical Interfaces

Three typical models for electrochemical activity change depending on the electrode resistance: (Left) Log[current] versus overpotential (arrow indicates the deviation with increasing electrode ohmic resistance), and (right) scheme of each scenario: (a) Not all particles are active sites, (b) potential variation model due to ohmic loss of applied potential, (c) mixture of models (a) and (b). (d) Electrode ohmic resistance measured by 4-point probe method as a function of carbon additive ratio for crystalline MoS₂, and current-potential plots of the electrochemical hydrogen evolution reaction (HER) activity for the same material.

Dong Young Chung, Subin Park, Pietro P. Lopes, Vojislav R. Stamenkovic, Yung-Eun Sung, Nenad M. Markovic and Dusan Strmcnik, "Electrokinetic Analysis of Poorly Conductive Electrocatalytic Materials", *ACS Catal.* 2020, 10, 4990–4996

Scientific Achievement

A model of the impact of poor material conductivity on the evaluation of its electrochemical properties was developed. A systematic evaluation of such materials is reported, and facilitates the link between fundamental and functional properties.

Significance and Impact

Mitigation of poorly conductive materials employed at electrochemical interfaces enables development of sustainable systems for energy conversion. Key electrochemical parameters for the hydrogen evolution reaction, such as Tafel slope and intrinsic activity were revealed by high precision electrochemistry.

Research Details

- Model developed for MoS₂ HER catalyst
- MoS₂ needed to be mixed with conductive carbon to obtain correct kinetic parameters.

What's New

[BES 40th Anniversary Report Summaries](#)

[EPSCoR Implementation](#)

Basic Energy Sciences (BES) supports fundamental research to understand, predict, and ultimately control matter and energy at the electronic, atomic, and molecular levels in order to provide the foundations for new energy technologies and to support DOE missions in energy, environment, and national security. The BES program also plans, constructs, and operates major scientific user facilities to serve researchers from universities, national laboratories, and private institutions. The BES program
