2020 DOE Hydrogen Program Annual Merit Review
May 19-21, 2020

This presentation does not contain any proprietary, confidential, or otherwise restricted information

Overview

Timeline

- Project start date: 9/1/2017
- Project end date: 8/31/2020
- % complete: 80%

Budget

- Total project funding: \$931,643
 - DOE share: \$804,462
 - Penn State share: \$127,181
- Funding for FY2019-20: \$308,492
- 1st Go/no-Go decision: Pass in September 2018
- 2nd Go/no-Go decision: Pass in October 2019

Barriers

- System weight & volume
- System cost, efficiency, durability
- Charging/discharging rates
- Suitable H₂ binding energy
- High polymer surface area

Partners

- LightMat consortium
- Oak Ridge National Lab.

Relevance: DOE cost targets

5 gallon tank with 700 bars pressure
5 Kg H₂ storage for 300 miles driving
range (45-60 miles/Kg H₂)
High Cost (~ \$3,000 per vehicle)

Composite overwrapped pressure vessel for 5.6 Kg usable hydrogen

	Energy cost (\$/kWh)	System cost (\$/vehicle)
2013 system	\$17	\$3,200
2015 system	\$15	\$2,800
DOE Target	\$10	\$1,900

Type IV COPV system with polymer liner and
annual production rate of 500,000 systems

DOE 2015 cost analysis indicated that 62% of the system cost would come from the cost of carbon fiber (CF)

Relevance: Tensile Properties

PAN precursor

Advantages:

Applied tension during the conversion
Low defects, Good alignment, High strength

Disadvantages:

High cost, Wet-spinning, Low C yield (50%)

PAN Polymer

Pitch from petroleum or coal tar (PAH mixture with Mw. 200-800 g/mole)

Pitch precursor

Advantages of Pitch precursor:

Low cost, melt-spinning, high C yield (up to 80%)

Disadvantages:

No applied tension during the conversion
High defects, Poor alignment, Low strength

How to design a precursor with the combined advantages?

Relevance: PAN thermal conversion

Stabilization

(200-300 °C in Air)

Carbonization

(1000-2000 °C under N_2)

(Conjugation, Dehydrogenation, Crosslinking)

(Heteroatom Removal and Ring-fusion)

PAN offers low C-yield ~50%, due to the combination of inhomogeneous stabilization in core area and drive-off N, O, and H heteroatoms.

Approach: Design hydrocarbon polymers

(i) high C-yield and (ii) one-step conversion under N_2

Polystyrene (PS) backbone

Poly(phenylacetylene) (PPA) backbone

PS

PS-V

PS-PA

PPA

PPA-A

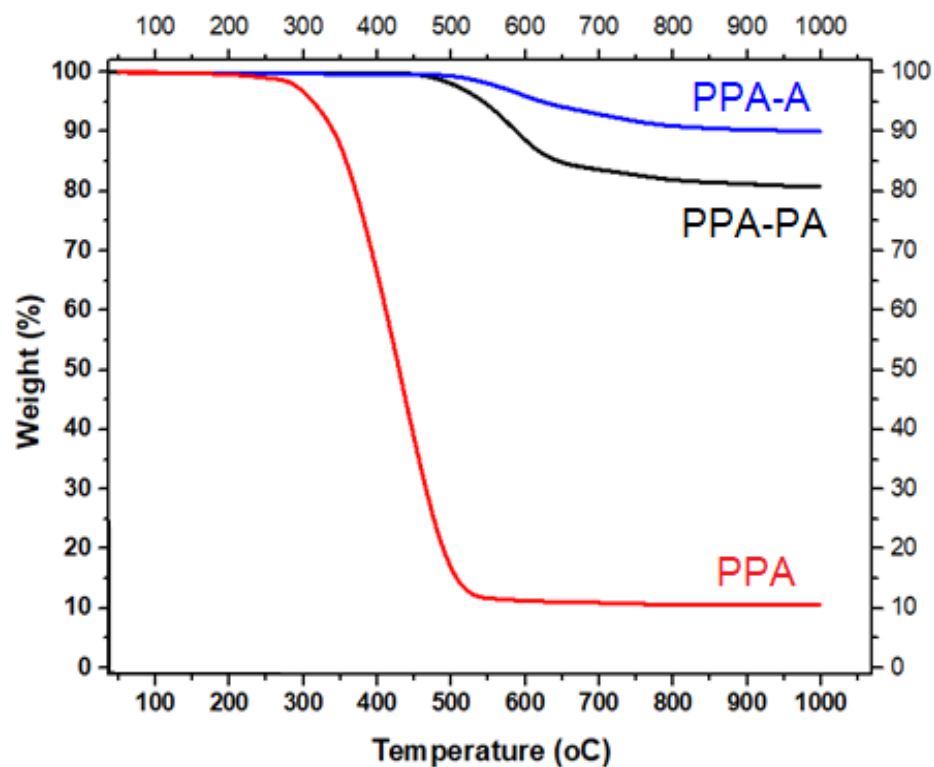

PPA-PA

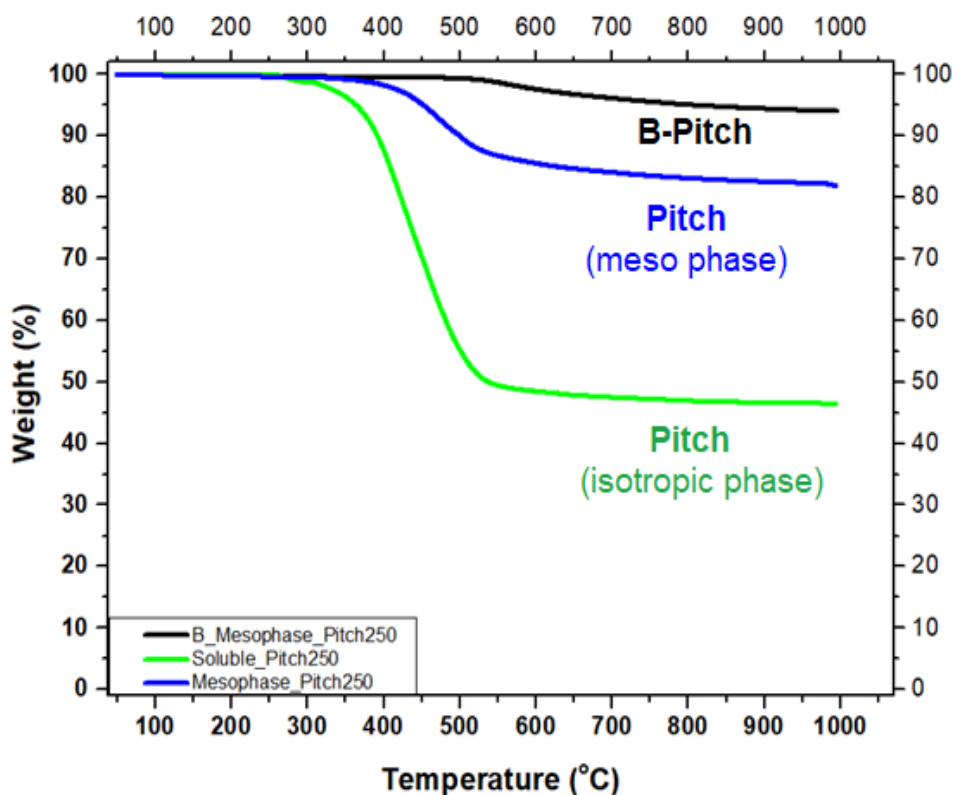

Thermal-induced stabilization reactions without O_2 :

- Dehydrogenation reaction
- π -Electrons conjugation
- Crosslinking reaction

Accomplishments: C-yields of polymer structures (one-step thermal conversion under N₂)

Accomplishments: C-yields of pitch structures (PAH) (one-step thermal conversion under N₂)

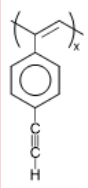

¹¹B NMR of several B/C materials

Approach: Design new PE-g-Pitch precursors

with (i) high C-yield under N_2 , (ii) melt processible, and (iii) low-cost

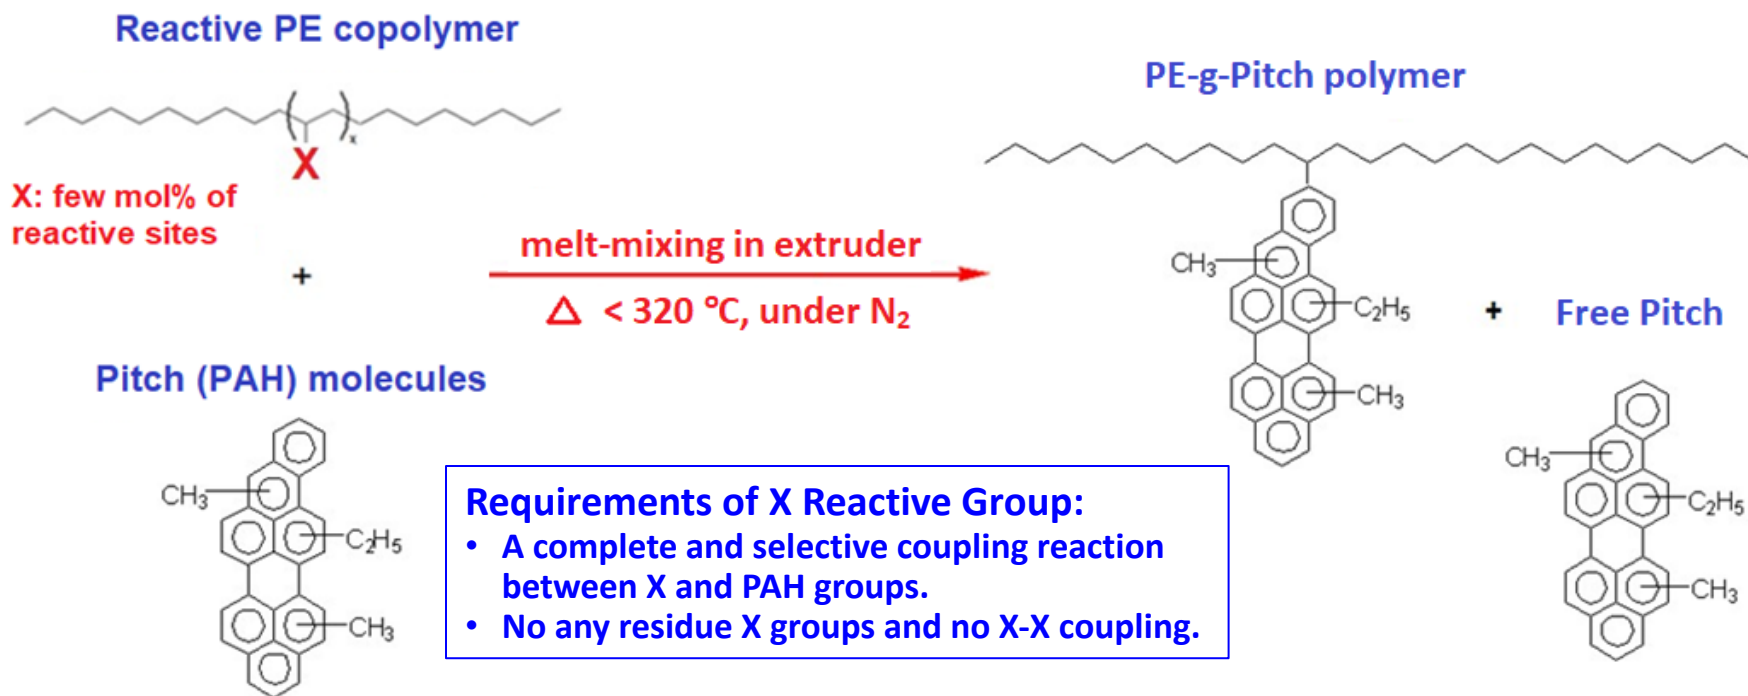

PPA-A

PPA-PA

Both PPA-A and PPA-PA precursor polymers with high C-yields are solution-processible, but not melt-processible. They start the stabilization reactions before their softening temperature. They are also not low-cost precursors.

PE-g-Pitch shall be stable and melt-processible at $<350\text{ }^\circ\text{C}$ (Pitch reaction temperature)

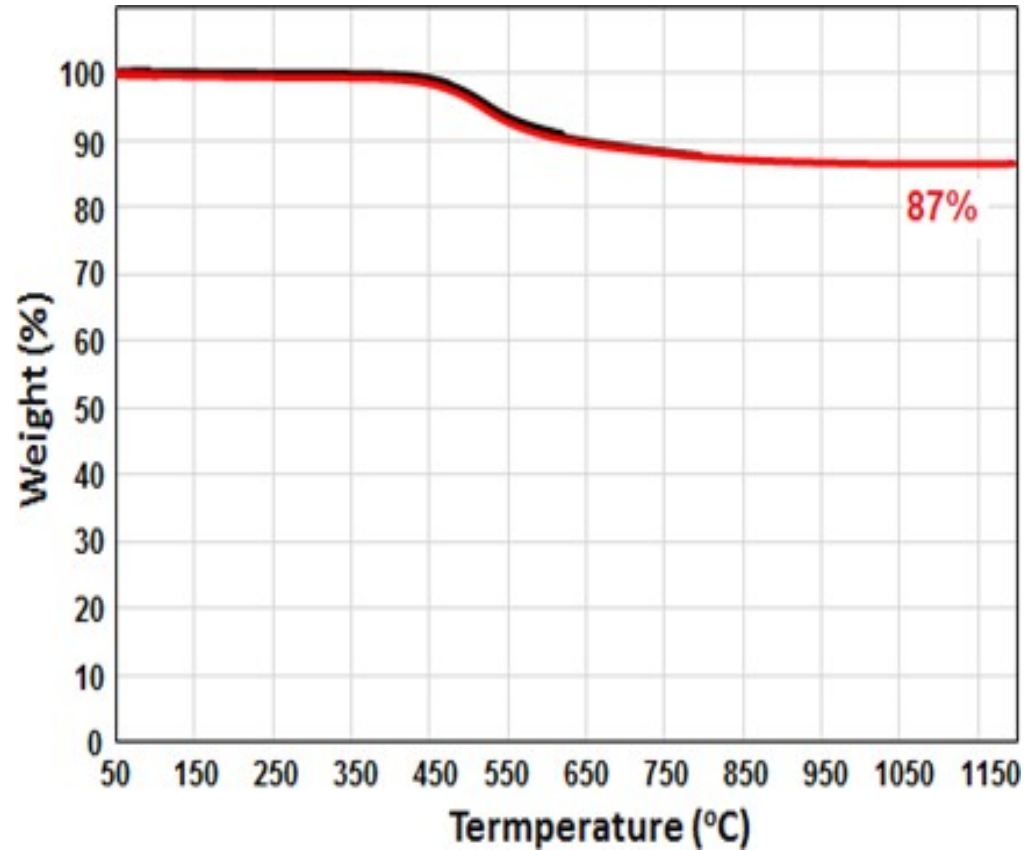

Accomplishment: PE-g-Pitch (I) (mesophase precursor)

PE-g-Pitch polymer (I)

Mesophase

TGA curve under N₂

One step C conversion under N₂ atmosphere with high C-yield (87%)

The resulting mesophase PE-g-Pitch precursor shows high melt-viscosity

Accomplishments: SEM micrographs of electrospun Mesophase PE-g-Pitch (I) fibers

Dry-spinning from 30 wt% polymer solution in toluene solvent

Accomplishments: PE-g-Pitch (I) (isotropic Pitch)

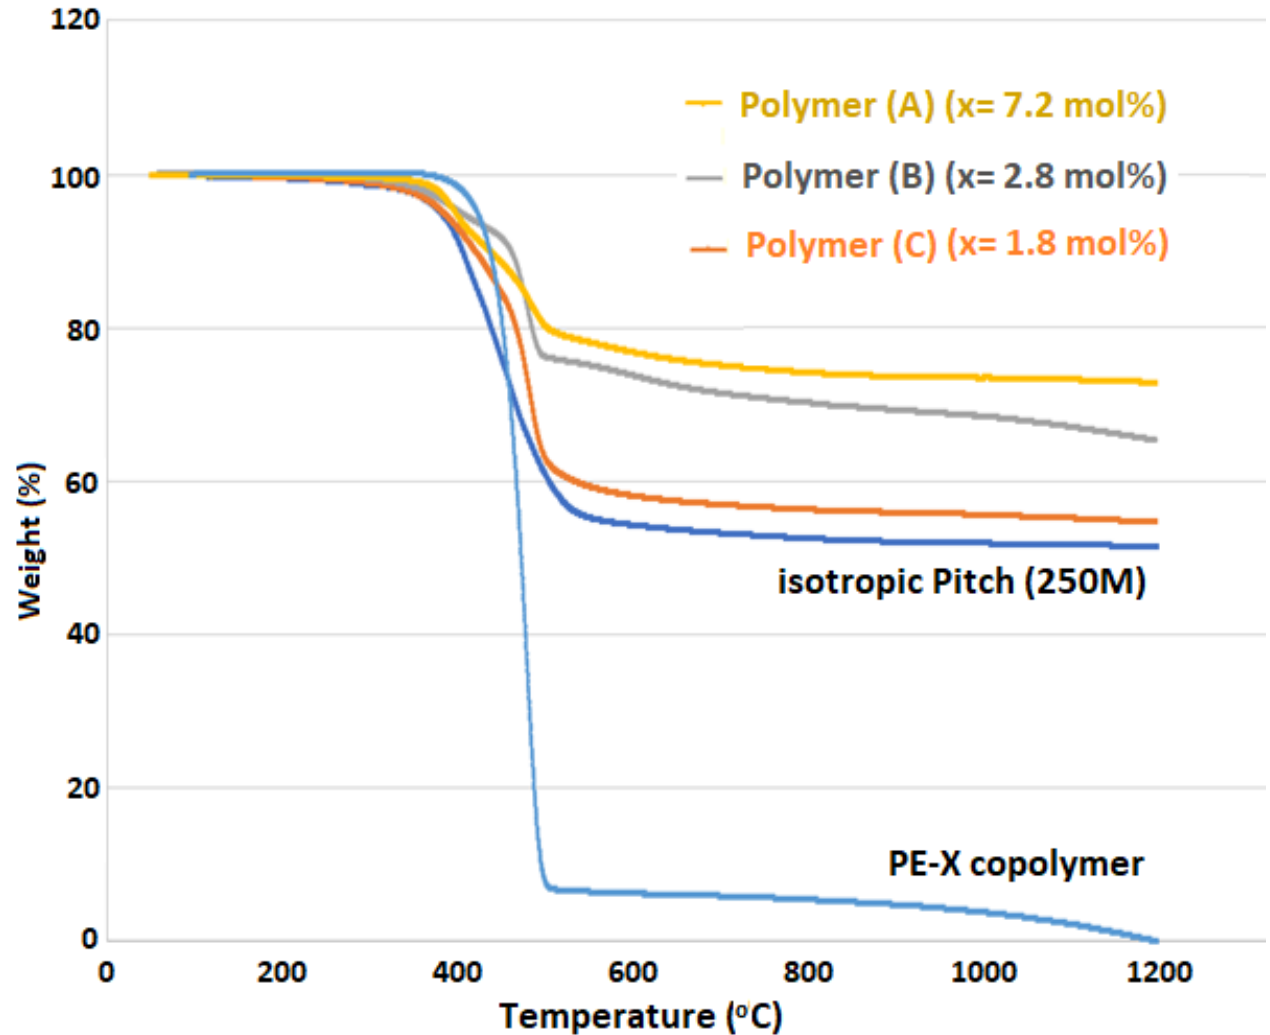

PE-g-Pitch (I)
(isotropic)

Polymer (A): $x=7.2$ mol%

Polymer (B): $x=2.8$ mol%

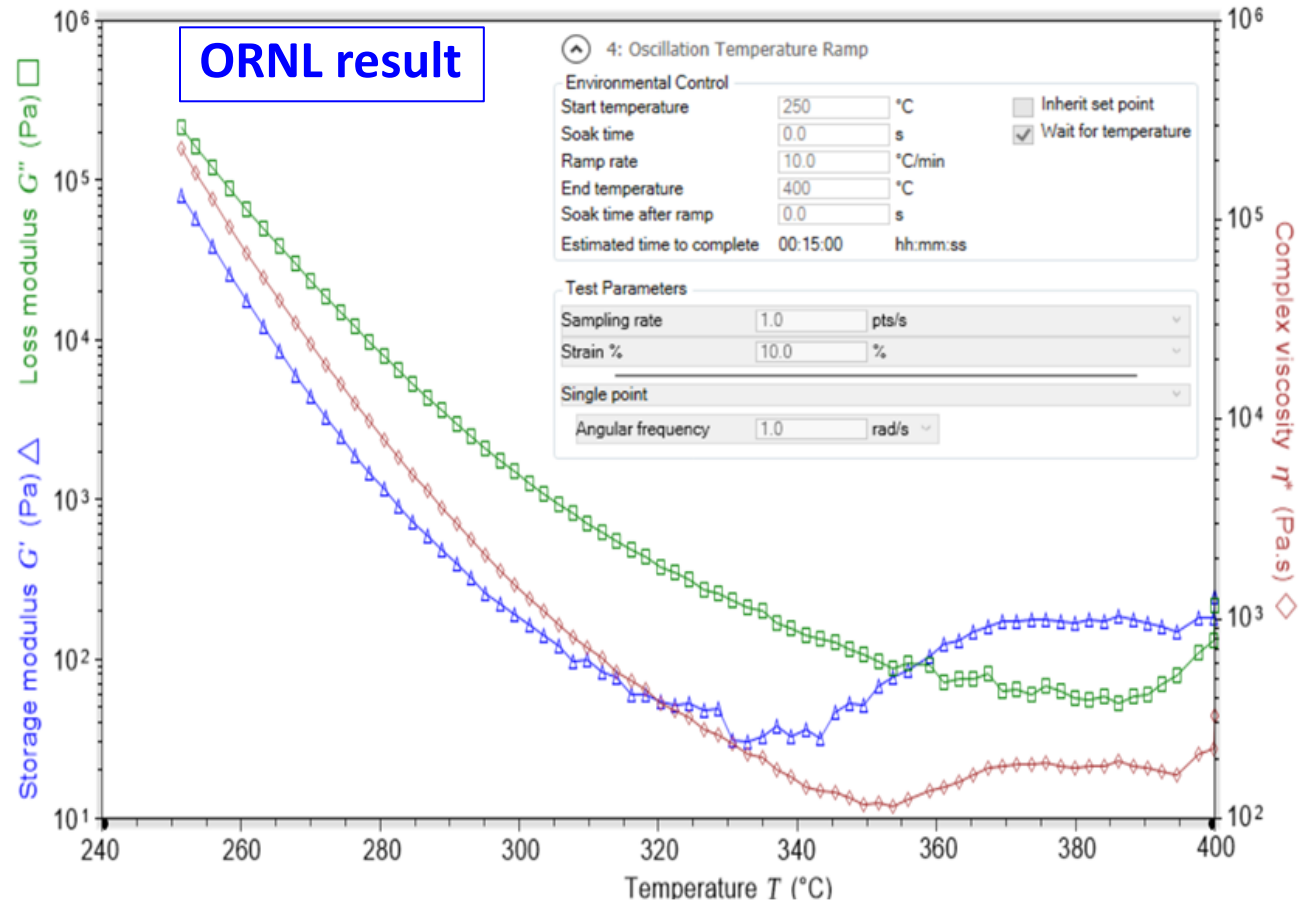

Polymer (C): $x=1.8$ mol%

All PE-g-Pitch (I) precursors show higher C yield than both PE-X and Pitch.

Accomplishments: Melt-processible PE-g-Pitch (I)/Pitch

Oscillation Rheology (temperature sweep)

- The suitable melt-processing temperature <330 °C
- This PE-g-Pitch (I) precursor was scaled up to >100g for the melt-spinning at ORNL

Accomplishments: Melt-spun PE-g-Pitch fibers at ORNL

- PE-g-Pitch precursor was spun continuously using ORNL laboratory-scale single-filament spinning apparatus in the temp. range of 320-360 °C.
- The fiber shows somewhat uneven surfaces and many small voids.

Accomplishments: PE-g-Pitch (I) precursor

- PE-g-Pitch (I) polymer (with meso-phase pitch) shows >85% C-yield and uniform fibers by solution-spinning, but not melt-processible.
- PE-g-Pitch (I) polymer (with isotropic pitch) shows >70% C-yield and is melt-processible with some free Pitch (Plasticizer). However, it is difficult to prepare uniform fiber due to instability of polymer at >330 °C (melt-processing temp.).

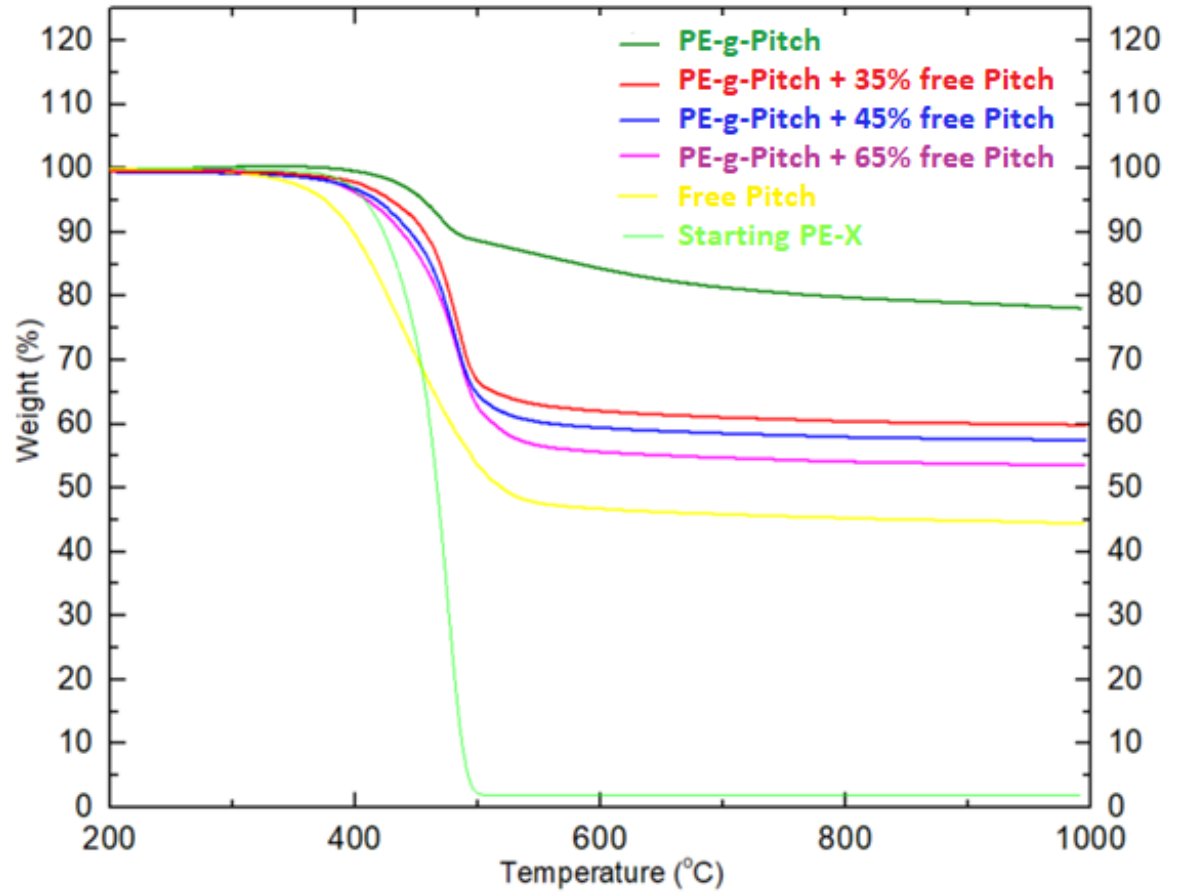

PE-g-Pitch (I)

x-Network formation

Require the PE-X copolymer with reactive X groups that can achieve completely and selectively coupling reaction with PAH molecules.
(No residue X groups and no X-X coupling reaction)

Accomplishments: New PE-g-Pitch precursor (II)

Sample	PE-g-Pitch	PE-g-Pitch with 35% free Pitch	PE-g-Pitch with 45% free Pitch	PE-g-Pitch with 65% free Pitch	Free Isotropic Pitch	Starting Reactive PE-X
C-Yield	78.4	60.1	57.6	53.2	49.4	2.1

Accomplishments: Melt-processible PE-g-Pitch precursor (II)

Oscillation Rheology (temperature sweep)

Sample	C-Yield
PE-g-Pitch	78.4
PE-g-Pitch + 35% Pitch	60.1
PE-g-Pitch + 45% Pitch	57.6

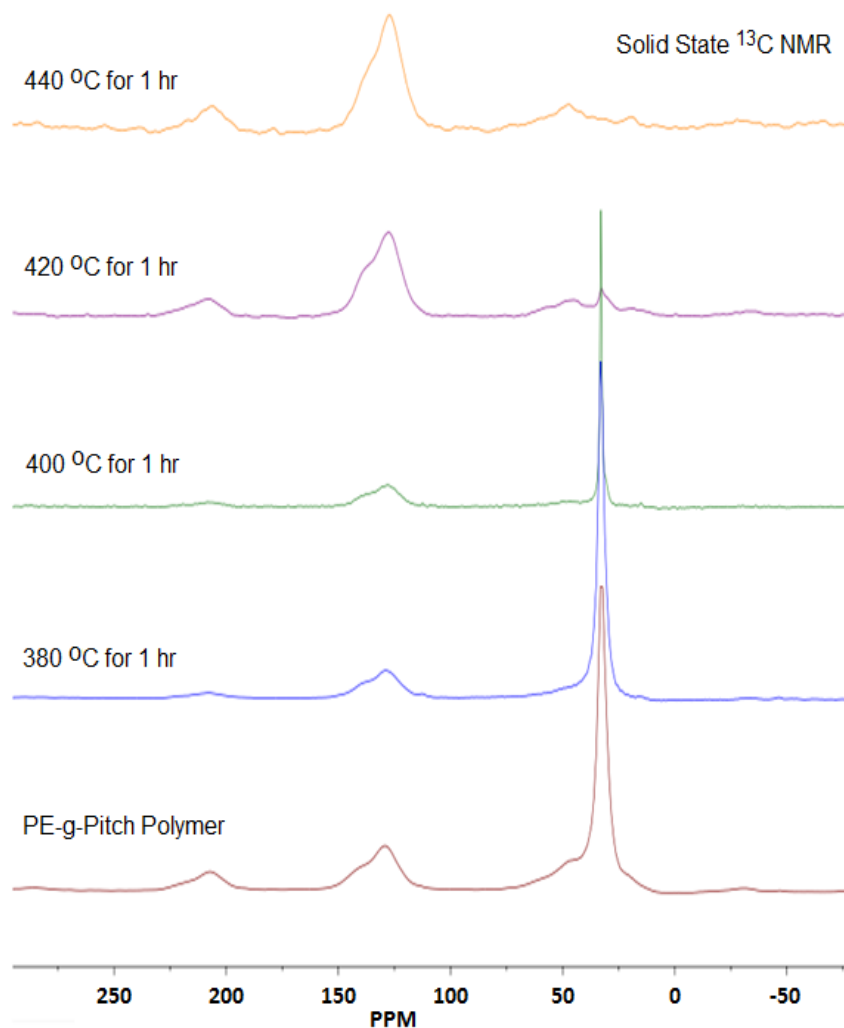

The most suitable precursor composition:
PE-g-Pitch with 45% free Pitch.

The most suitable melt-spinning temp:
320-340 $^{\circ}\text{C}$.

Accomplishment: Stabilization Mechanism of PE-g-Pitch Precursor

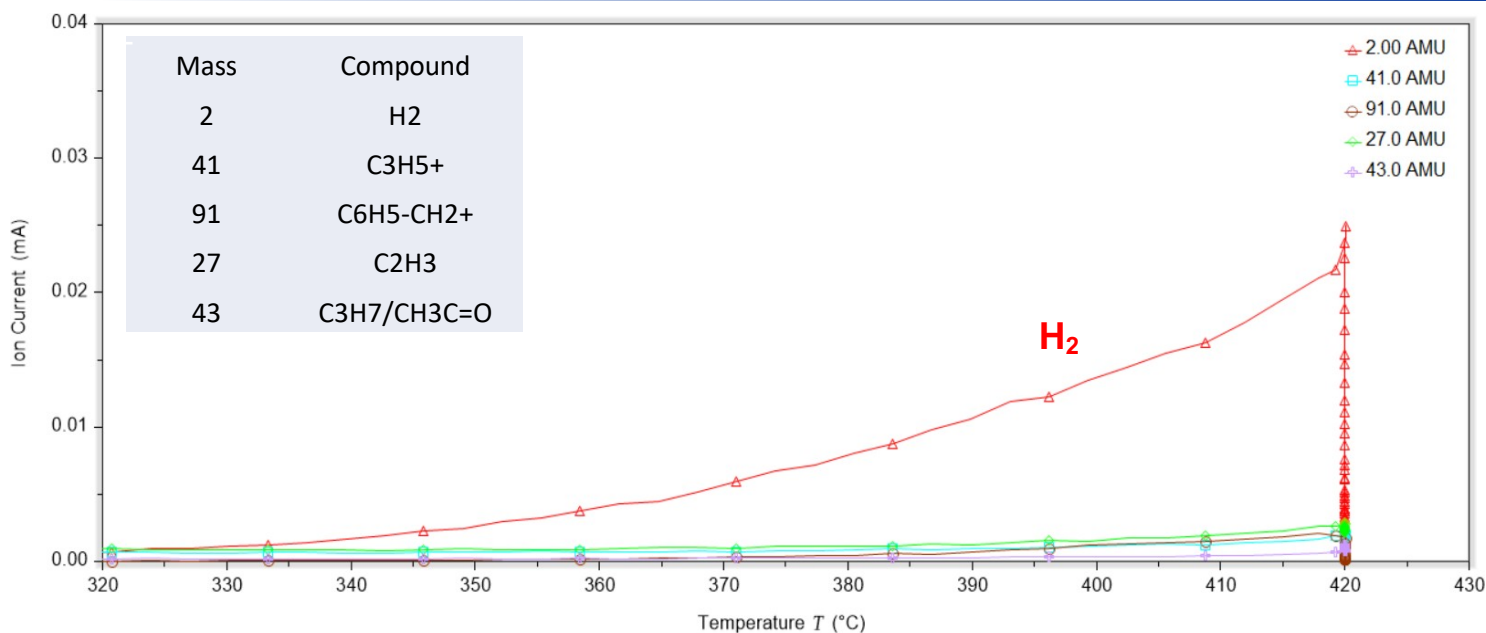

Accomplishments: ^{13}C NMR and XRD spectra of PE-g-Pitch fiber during thermal conversion to CFs under N_2

PE polymer chain is converted to aromatic structure at 400-440 °C under N_2

Accomplishment: TGA-Mass Results during Stabilization

Accomplishments: XRD comparison of Carbon Fibers

Temperature (°C)	PE-g-Pitch based Carbon Fiber			PAN-based Carbon Fibers*	
	D ₀₀₂ interlayer spacing (nm)	Lc (nm)	La (nm)	D ₀₀₂ interlayer spacing (nm)	Lc (nm)
1500 (Sample 1)	0.3674	1.5774	5.1327	0.361	2.0
1700 (Sample 1)	0.3500	2.5778	6.2958	0.357	2.5
1900 (Sample 1)	0.3480	3.2731	7.4849	0.351	3.1
1400 (Sample 4)	0.3708	1.2968	4.6150	0.364	2.0
1700 (Sample 4)	0.3549	1.6697	5.9562	0.357	2.5
1900 (Sample 4)	0.3524	3.9405	6.9944	0.351	3.1

* Inorganic Materials: Applied Research 2018, 9, 890-899

Accomplishment: Raman Spectra of Resulting Carbon Fibers

(carbonization at 1400, 1700, 1900 °C for 1h under N₂)

From PE-g-Pitch precursor with
79% free Pitch (Sample 1)

From PE-Pitch precursor with
40% free Pitch (Sample 4)

The integrated intensity ratio ($R=I_D/I_G$) for PAN-based carbon fibers is about 1

Milestones and Deliverables Summary Table

Recipient Name: T. C. Mike Chung		Project Title: Developing A New Polyolefin Precursor for Low-Cost, High-Strength Carbon Fiber					
Task Number	Task or Subtask (if applicable)	Milestone, Go/No-Go Decision	Milestone Number	Milestone Description (Go/No-Go Decision Criteria)	Milestone Verification Process	Anticipated Date (Months)	Anticipated Quarter (Quarters)
	1	Synthesis of Diene Monomers	Milestone	M1.0	Synthesis route and two diene monomers by ¹ H and ¹³ C NMR spectra	¹ H and ¹³ C NMR spectra of the resulting monomers.	1-2
2.1	Synthesis of PE Copolymers with DVB and BSt units	Milestone	M2.1	Confirm two resulting polymer structures by GPC curves and ¹ H NMR spectra	GPC curves and ¹ H NMR spectra of two polymers.	3-6	1-2
2.2	Synthesis of Poly(DVB) and Poly(BSt) Homopolymers	Milestone	M2.2	Confirm two resulting polymer structures by GPC curves and ¹ H NMR spectra	GPC curves and ¹ H NMR spectra of two polymers.	7-9	2-3
3	Stabilization and Carbonization Study	Milestone	M3.0	Convert precursors to C materials (yield >80%) after pyrolysis at 1500 °C	Mass yield, TEM, XRD, elemental analysis.	8-12	2-4
1st Go/No-Go Decision on Precursor development for low-cost, high-strength carbon fiber		New polyolefin precursors that can be efficiently prepared with high yields (>70%) and transformed to C with mass yield (>80%), more than 60% higher than that of current PAN with mass yield (<50%).			Send 10 slides to LightMat /DOE summarizing all results demonstrating >80% C- yield.	The end of M12	The end of Q4
4	Scaling Up the Selected Polyolefin Precursors	Milestone	M4.0	Selected precursors with Kg quantity	¹ H NMR, GPC, DSC and TGA spectra.	13-15	5
5.1	Melt-Spinning of Polyolefin Precursors	Milestone	M5.1	Fiber-spinning to polyolefin fibers	Pictures and Videos	16-21	6-7
5.2	Carbonization of Polyolefin Fibers	Milestone	M5.2	New polyolefin based CF products	TEM, SEM, XRD, Raman, and elemental analysis .	19-24	7-8
2nd Go/No-Go Decision on Precursor development for low-cost, high-strength carbon fiber		New low-cost and high-quality carbon fiber prepared by a combination of polyolefin precursor and melt-spinning process. The resulting polyolefin-based CFs shall exhibit similar nano-polycrystalline morphology presented in current high tensile strength PAN-based carbon fibers.			Send 10 slides to LightMat /DOE summarizing all experimental results. Fiber samples will be provided to DOE for independent verification if requested.	The end of M24	The end of Q8
6.1	Developing a New Carbonization Process under Mechanical Tension	Milestone	M6.1	A new carbonization system with mechanical tension	TEM, SEM, Raman, XRD, and Instron results.	25-30	9-10
6.2	Carbonization of PE-Pitch (with or without free Pitch) Precursor Fibers under Tension	Milestone	M6.2	New CF converted from PE-Pitch fiber shows tensile strength >3 GP	Raman, XRD, and Instron results.	30-33	10-11
6.3	Identifying Suitable Process Condition for Carbonization of PE-Pitch Precursor Fibers under Tension	Milestone	M6.3	Improve carbonization condition to achieve tensile strength >4.5 GPa	Raman, XRD, and Instron results.	33-36	11-12
Final Project Objective		New low-cost polyolefin-based CFs that can exhibit mechanical property like Toray T700S fiber, with 4.9 GPa tensile strength and 230 GPa tensile modulus.				The end of M36	The end of Q12

Future: High tensile strength CFs

Nano-polycrystalline ✓
Order-disorder ratio ✓
Structure defects (voids)
Orientation of basal line
Fiber diameter

- Carbonization under mechanical stretching (tension) to remove defects, orient basal line, and control fiber diameter
- Control heating and winding rates

Future Work: PE-co-B-Pitch Fiber and B-Carbon Fiber

Melt-spinning on PE-co-B-Pitch:

- PE-X with various reactive group (X) and content
- B-Pitch material with various composition and reactivity
- Thermal condition for forming melt-processable PE-co-B-Pitch precursor
- Melt-spinning with continuous heating/mechanical tension
- Carbonization process under mechanical tension (stretching)

Any proposed future work is subject to change based on funding levels.

Summary

In this research project, we have developed a new class of polymer precursors based on a PE-g-Pitch graft copolymer containing PE backbone and Pitch side chains with some free Pitch molecules (serving as plasticizer and precursor).

Several potential benefits of this PE-Pitch precursor over current PAN precursor.

1. Low material cost: inexpensive PE and Pitch
2. Low processing cost: melt-spinning process
3. Low thermal conversion cost: one-step heating under N₂
4. Uniform thermal conversion from fiber core to the surfaces
5. Higher carbon conversion yield
6. Resulting similar nano-polycrystalline carbon fiber morphology

Future Research: Thermal conversion under tension (stretching) to align graphene nano-crystals (order phase) and C chains (disorder phase) along the fiber direction and reduce structural defects (voids).
