

DOE Hydrogen and Fuel Cells Program Record		
Record #: 16015	Date: May 24, 2016	
Title: Current U.S. Hydrogen Production		
Originator: Fred Joseck, Tien Nguyen, Benjamin Klahr, and Amit Talapatra		
Peer reviewed by: Daryl Brown, Roger Han, Deepali Kandekar, Kareem Basha, Piyush Kamble		
Approved by: Eric Miller and Sunita Satyapal	Date: May 24, 2016	

Item

The United States currently produces approximately 10 million metric tons (MMT) of hydrogen per year; a production scale equivalent to the fuel needs of roughly 50 million light-duty fuel cell electric vehicles (FCEVs). In comparison, worldwide hydrogen production is estimated to be between 61 and 65 MMT per year.^{1,2}

Supporting Information and Calculations

- The United States produces approximately 10 MMT of hydrogen per year.

Table 1. U.S. hydrogen production (shown in MMT)^{1,2}

U.S. Hydrogen Production (2014)	Source 1¹	Source 2²
Captive Production	5.26	5.86
<i>Petroleum Refineries</i>	<i>3.60</i>	<i>3.40</i>
<i>Ammonia</i>	<i>1.27</i>	<i>2.03</i>
<i>Methanol</i>	<i>0.11</i>	<i>0.43</i>
<i>Other(e.g., cyclohexane, aniline, etc.)</i>	<i>0.28</i>	
Merchant Production	3.77	3.83
<i>Refineries</i>	<i>2.64</i>	<i>3.19</i>
<i>Ammonia</i>	<i>0.87</i>	
<i>Other (e.g., cyclohexane, aniline, methanol, etc.)</i>	<i>0.26</i>	<i>0.64</i>
Total Domestic Production	9.03	9.69

Hydrogen is an important chemical commodity in petroleum refining, ammonia production, and methanol production. For these industries, hydrogen is required on such a large scale that a majority of it is intentionally produced on site. This is called *captive* hydrogen production. In addition, *merchant* hydrogen is produced, shipped, and sold as an industrial gas. *Captive* and *merchant* production categories are the only categories considered in this record.³

- 9.7 MMT of hydrogen per year is a production scale equivalent to the fuel needs of up to 47 million FCEVs.

The following assumptions were used to calculate the number of FCEVs powered by hydrogen:

- Each new FCEV is driven 13,533 miles per year (2009).⁴
- The fuel economy of a Toyota Mirai (the most prevalent light-duty FCEV) is 66 miles per kg of hydrogen.⁵

The number of vehicle miles possible for a hydrogen production of 9.7 MMT:

- $9.7 \text{ MMT} \times 1,000 \text{ kg/tonne} \times 66 \text{ miles/kg} = \underline{640 \text{ billion miles}}$

The number of FCEVs that can be fueled by 9.7 MMT of hydrogen per year:

- $640 \text{ billion miles divided by } 13,533 \text{ miles per vehicle per year} = \underline{47 \text{ million FCEVs}}$

For the purpose of this record, the United States hydrogen production is rounded to 10 MMT per year and the number of FCEVs this could theoretically support is rounded to 50 million.

Endnotes and References

³ Hydrogen is also produced as an industrial *by-product* in industries including iron production, ethylene production, oil refining and chlor alkali industries. This hydrogen was not included in this analysis because it is not intentionally produced.
