

# Nanostructured MoS<sub>2</sub> and WS<sub>2</sub> for the solar production of hydrogen

Thomas F. Jaramillo  
Dept. of Chemical Engineering  
Stanford University  
10 June 2010

DOE Hydrogen Review Meeting  
Washington, D.C.

**Project ID # PD033**

This presentation does not contain any proprietary, confidential, or otherwise restricted information

# Overview

## Timeline

- Start – Dec 2008
- Finish – Dec 2009
- 100% complete

## Budget

- Total project funding
  - DOE - \$130k
  - Contractor - \$32k
- Funding received in FY09
  - \$130k
- Funding for FY10
  - TBD

## Barriers

- Y. Materials Efficiency
- Z. Materials Durability
- AB. Bulk Materials Synthesis

## Targets

Semiconductor	2006	2013	2018
Bandgap	2.8 eV	2.3 eV	2.0 eV
Efficiency	4 %	10 %	12 %
Durability	N/A	1000 hrs	5000 hrs

## Collaborations

- NREL
- U. Hawaii
- U. Louisville
- UNLV
- UC Santa Barbara
- The PEC WG

# Relevance: Objectives

The **main objective** of the project is to develop new photoelectrode materials with new properties that can potentially meet DOE targets (2013 and 2018) for usable semiconductor bandgap, chemical conversion process efficiency, and durability.

Table 3.1.10. Technical Targets: Photoelectrochemical Hydrogen Production <sup>a</sup>

Characteristics	Units	2003 Status	2006 Status	2013 Target <sup>a</sup>	2018 Target <sup>b</sup>
Usable semiconductor bandgap <sup>c</sup>	eV	2.8	2.8	2.3	2.0
Chemical conversion process efficiency (EC) <sup>d</sup>	%	4	4	10	12
Plant solar-to-hydrogen efficiency (STH) <sup>e</sup>	%	not available	not available	8	10
Plant durability <sup>f</sup>	hr	not available	not available	1000	5000

To date, there are no known materials that simultaneously meet these DOE targets.

# Relevance: Technology Barriers

Table 1. Materials-related “Technology Barriers” for successful PEC water-splitting: material class challenges and strengths for MoS<sub>2</sub> and WS<sub>2</sub>.

Barrier	Challenges	Strengths
Y. Materials Efficiency	<ul style="list-style-type: none"> <li>- Bandgap is too small at 1.2 eV</li> <li>- Indirect bandgap</li> <li>- C. Band 0.4 eV too low w.r.t. <math>E^0_{H^+/H_2}</math></li> <li>- Relatively low charge mobility along the c-axis (<math>0.1 \text{ cm}^2/\text{V}\cdot\text{sec}</math>)</li> </ul>	<ul style="list-style-type: none"> <li>- Absorbs large fraction of solar photons.</li> <li>- Nanostructuring can improve both bandgap problem and mismatched CB</li> <li>- High charge mobility along the basal plane (<math>&gt; 100 \text{ cm}^2/\text{V}\cdot\text{sec}</math>)</li> <li>- Excellent hydrogen evolution catalysis</li> </ul>
Z. Materials Durability	<ul style="list-style-type: none"> <li>- n-type materials are unstable due to photo-oxidation of the sulfide surface.</li> </ul>	<ul style="list-style-type: none"> <li>- p-type materials have demonstrated long-term photo-stability (<math>\sim 1000 \text{ hrs}</math>)</li> </ul>
AB. Bulk Materials Synthesis	<ul style="list-style-type: none"> <li>- Need to do develop low cost and scalable route to synthesize materials..</li> </ul>	<ul style="list-style-type: none"> <li>- Multiple sulfidation routes involving H<sub>2</sub>S, elemental sulfur or Na<sub>2</sub>S can be used</li> <li>- Mo and W are inexpensive and abundant.</li> <li>- Low temperature processing (<math>&lt; 250 \text{ C}</math>)</li> </ul>
A.C. Device Configuration Designs	<ul style="list-style-type: none"> <li>- Bulk MoS<sub>2</sub> or WS<sub>2</sub> would require a tandem/multijunction device configuration to account for band mismatch and small bandgap.</li> </ul>	<ul style="list-style-type: none"> <li>- Nanostructuring can overcome bandgap and band mismatch problems</li> </ul>

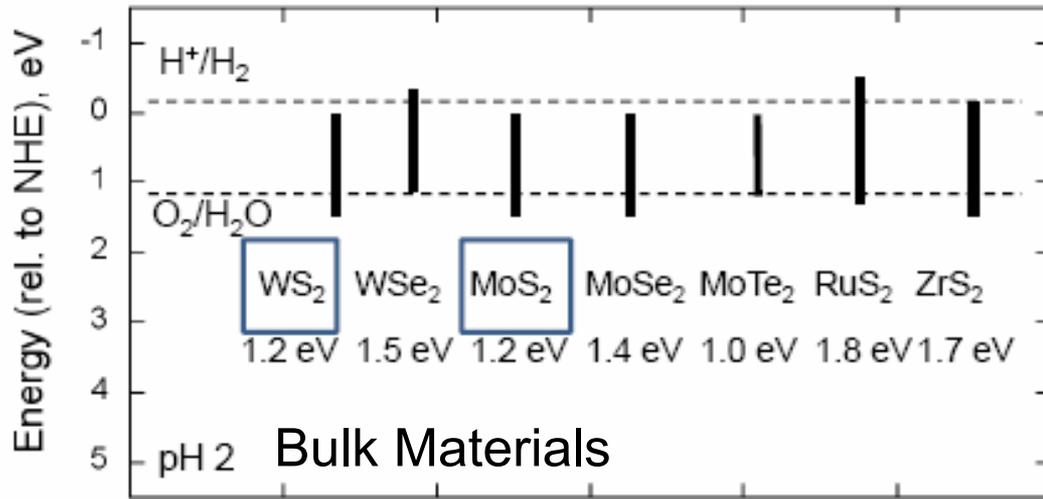

# Approach: Addressing the Challenges

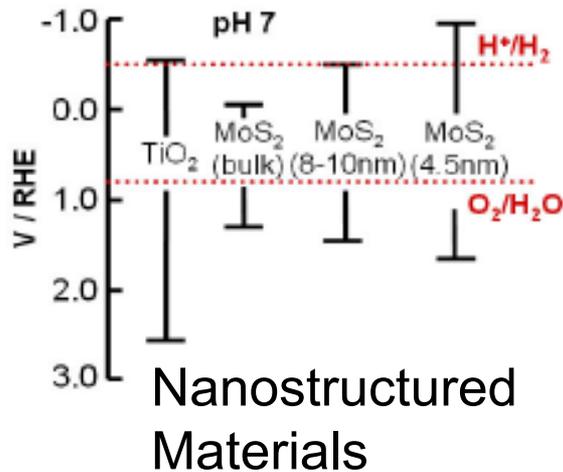

- **Y. Efficiency**
  - Electronic band structure can be widened via nanostructuring to achieve the desired 1.8 eV – 2.3 eV bandgap.
- **Z. Durability**
  - Targeting p-type materials for photocathodic operation, which improves stability.
- **AB. Bulk materials synthesis**
  - Developing low-cost wet-chemical based routes to nanostructures.
  - All elements are inexpensive and earth-abundant.
- **AC. Device configuration designs**
  - Tuning the bandstructure (see Y. Efficiency above) appropriately may prevent the need for tandem/multijunction devices.

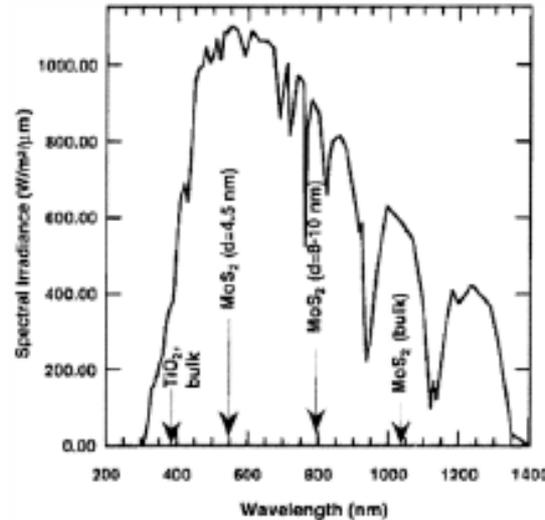

# Approach: Tuning Electronic Band Structure by Quantum Confinement

Jaegermann, W.; Tributsch, H. *Progress in Surface Science* 1988, 29, 1.

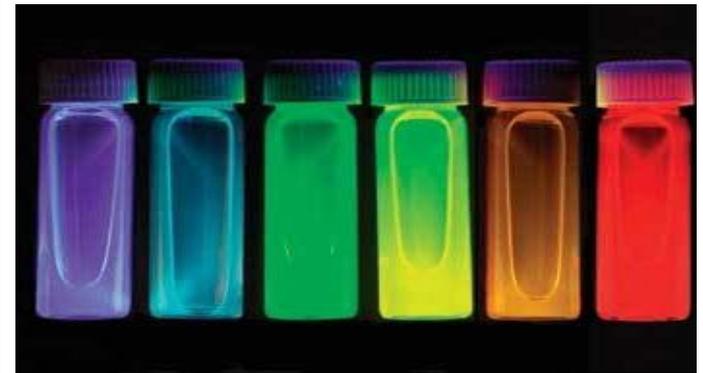

Thurston, T. R.; Wilcoxon, J. P. *Journal of Physical Chemistry B* 1999, 103, 11.

*This is a unique approach that diverges from the standard doping/alloying methodology that is commonplace in the field of PEC.*

CdSe: a “classic” example of quantum confinement

2 nm CdSe ← 8 nm CdSe

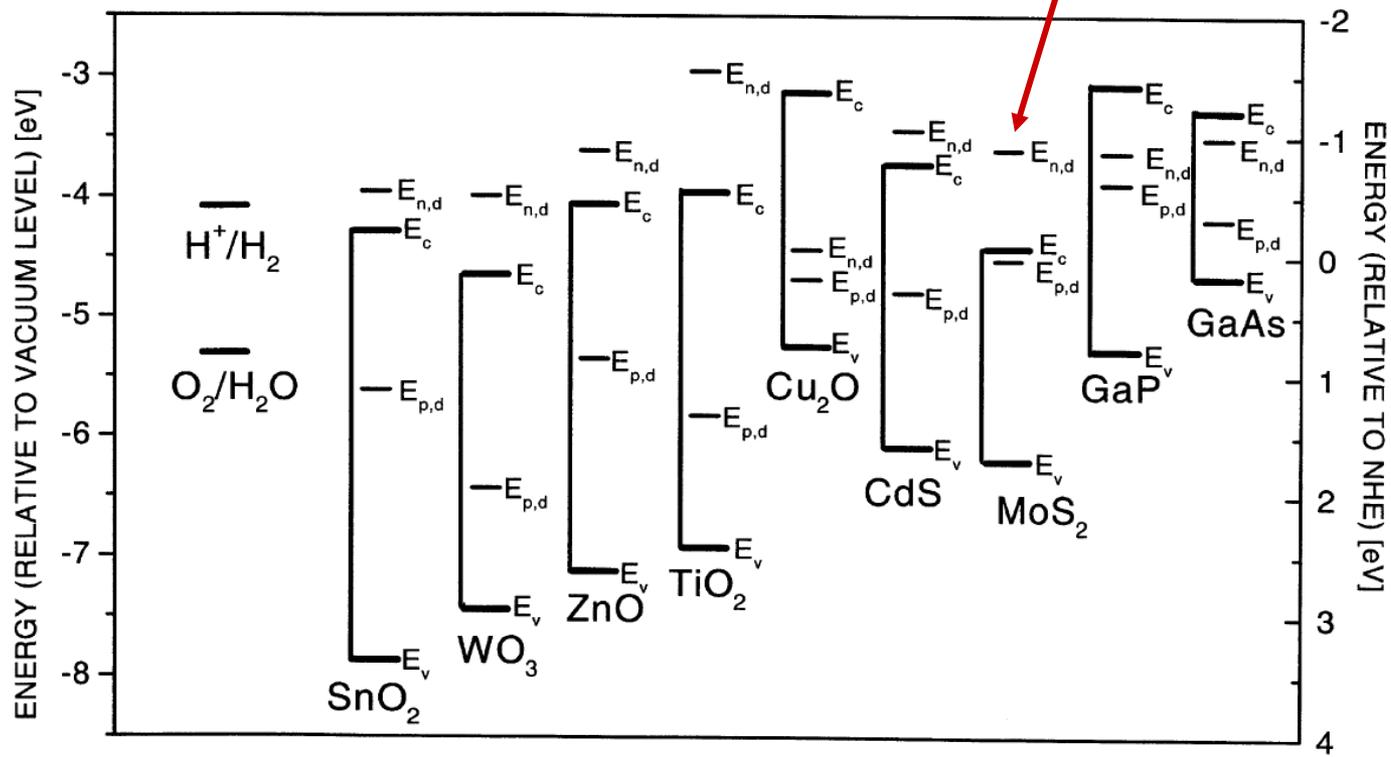

Bawendi et. al. (MIT)

# Approach: Improving durability

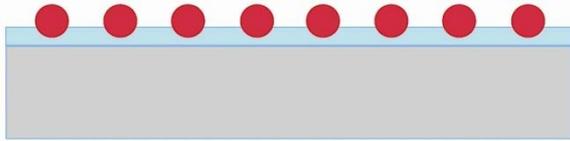

**Cathodic corrosion potential lies above  $E^0_{\text{H}^+/\text{H}_2}$ .  
Photocathodes (p-type) should be stable.**

Bak, T.; Nowotny, J.; Rekas, M.; Sorrell, C. C. *International Journal of Hydrogen Energy* **2002**, 27, 991.

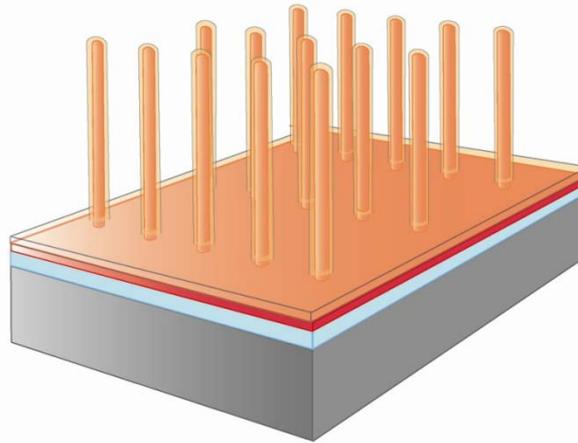

# Approach: Targeted Nanostructures

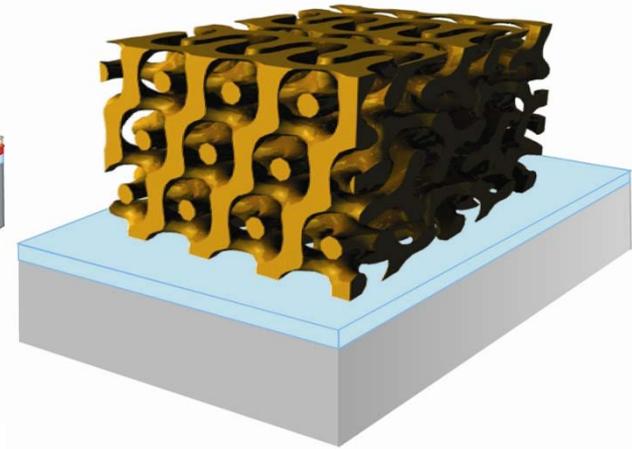

## Nanoparticles

- Establish monodispersity (size-control)
- Correlate bandgap to size
- Measure PEC

## Nanowires

- Develop synthesis route to achieve the appropriate dimensions

## 3-D Mesoporous

- Develop synthesis route to achieve the appropriate dimensions

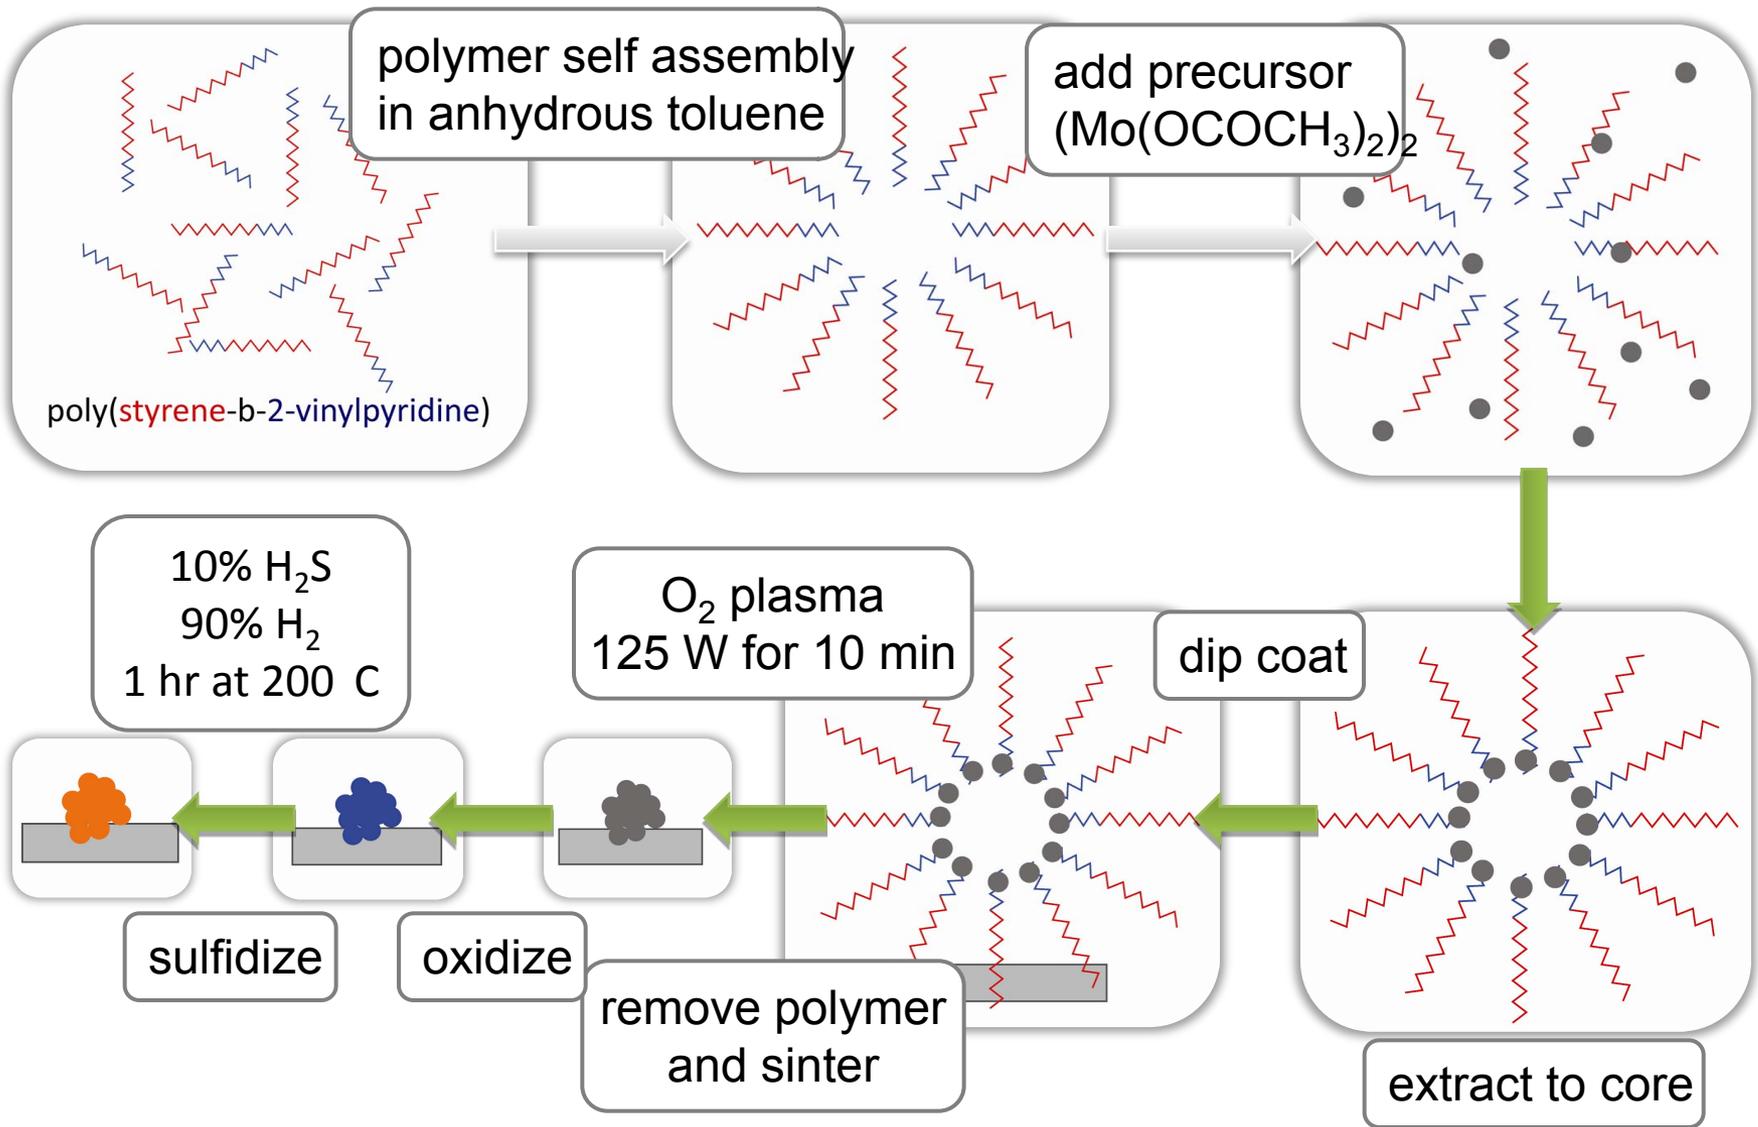

# Accomplishments: Milestones

Milestones	Progress Notes	Comments	% Comp.
Plan, develop, and perform synthesis and characterizations, both physical and photoelectrochemical, of nanoscale transition metal dichalcogenides.	Synthesized and characterized monodisperse nanoparticles and other nanoscale morphologies.	Demonstrated bandgap enlargement to 1.8 eV.	100 %
Correlate physical characterization test results with photoelectrochemical performance to tune subsequent syntheses in an effort to optimize water splitting efficiency and photoelectrode stability.	Nanoparticles show photoelectrochemical activity.	Require support onto 3-D transparent conducting scaffolds.	100 %

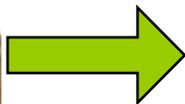

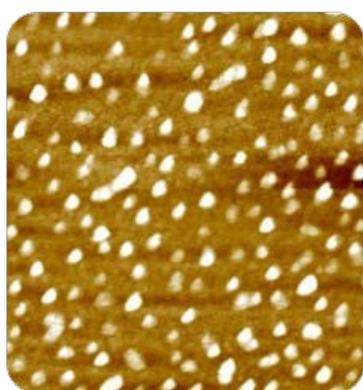

# Accomplishments: Monodisperse MoS<sub>2</sub> nanoparticle synthesis

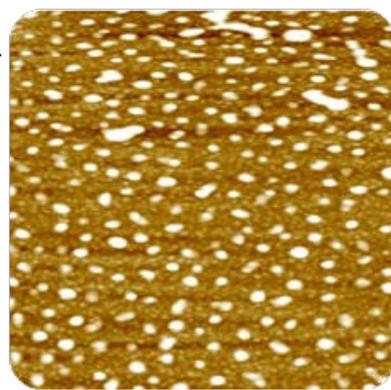

# Accomplishments: Low temperature sulfidization

MoO<sub>3</sub> nanoparticles

MoS<sub>2</sub> nanoparticles

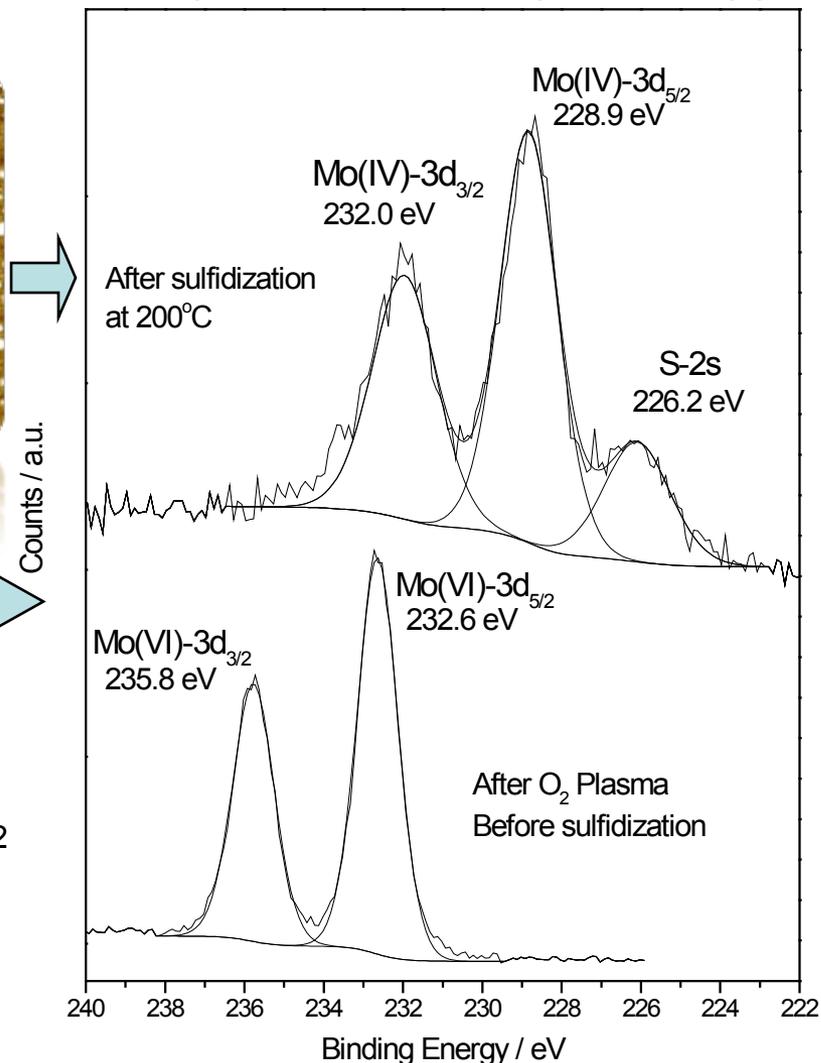

H<sub>2</sub>/H<sub>2</sub>S  
at  
200 C

Atomic Force Microscopy

X-ray Photoelectron Spectroscopy

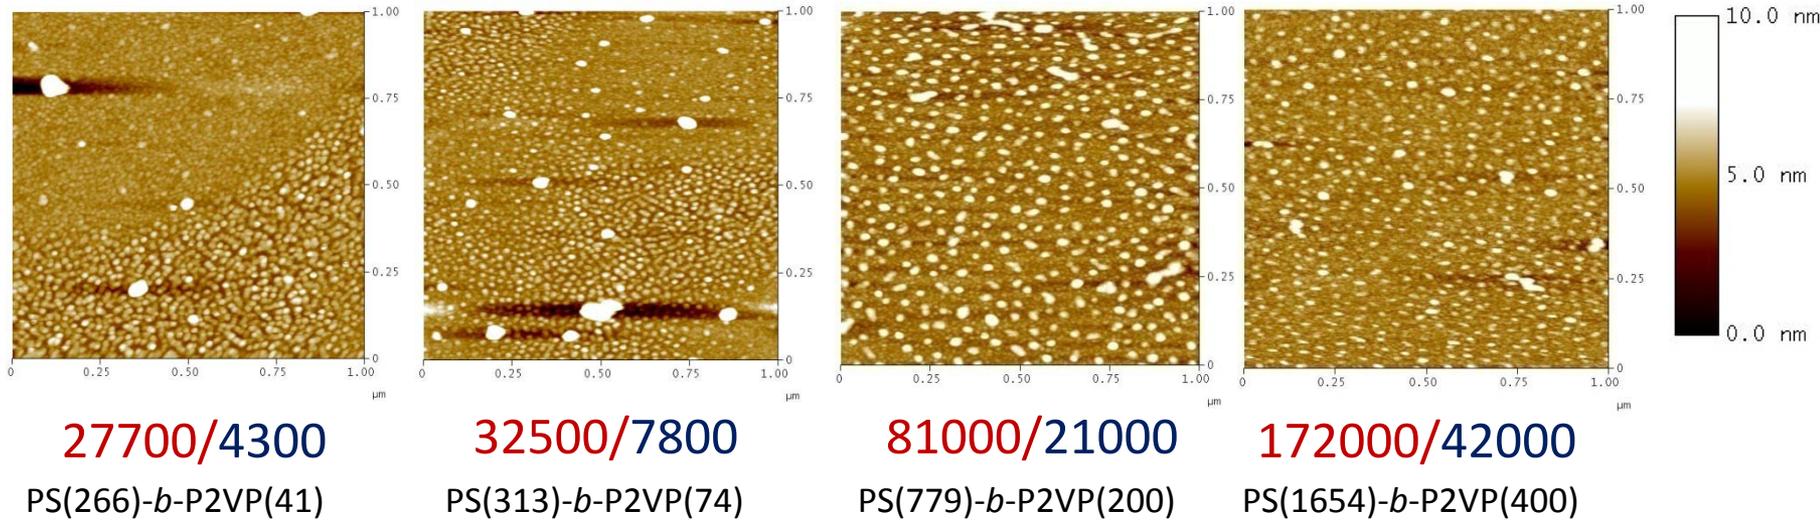

## Take home messages:

- (1) We have developed a synthetic route to synthesize well-defined, supported MoS<sub>2</sub> nanoparticles, with minimal sintering.
- (2) XPS shows that the MoS<sub>2</sub> nanoparticles are stable (not oxidized) in air.

# Accomplishments: Tuning nanoparticle size (AFM)

Increasing molecular weight block copolymer (PS/P2VP, units: Da)

Take home message:

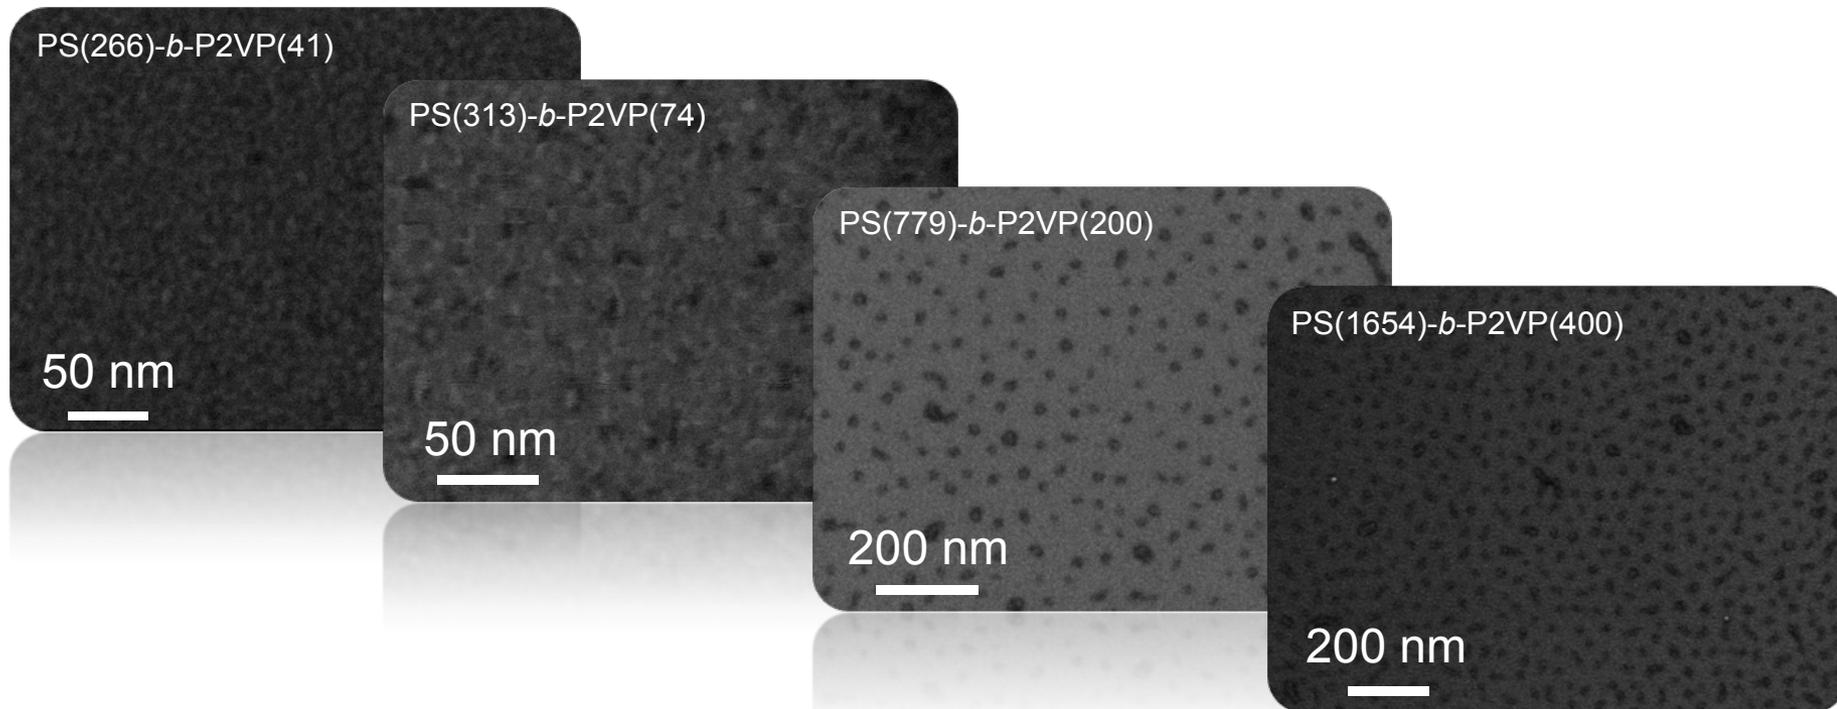

We can tailor MoS<sub>2</sub> nanoparticle diameter from 5-25 nm by choosing the appropriate block co-polymer and Mo precursor loading.

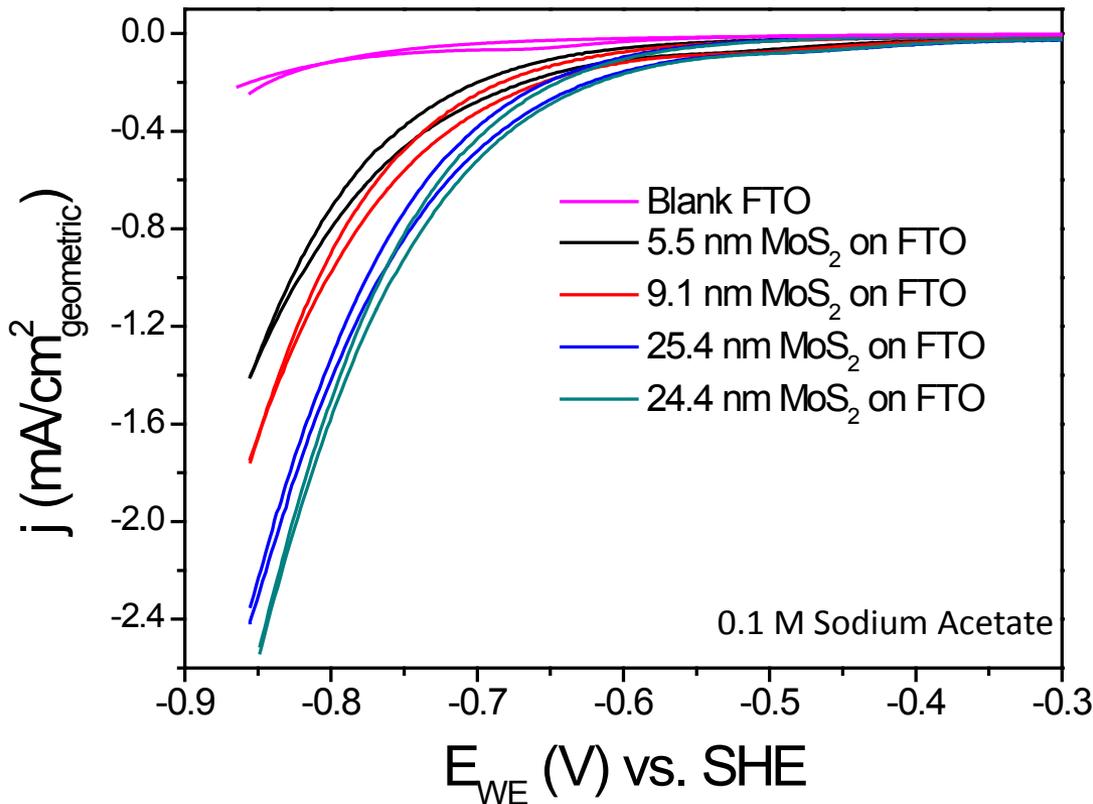

# Accomplishments: Tuning nanoparticle size (SEM)

	Average diameter (nm)	Standard deviation (nm)
PS(266)- <i>b</i> -P2VP(41)	5.5*	1.0
PS(313)- <i>b</i> -P2VP(74)	9.1	2.1
PS(779)- <i>b</i> -P2VP(200)	25.4	7.3
PS(1654)- <i>b</i> -P2VP(400)	24.4	5.7

\*Measurement limited to microscope resolution

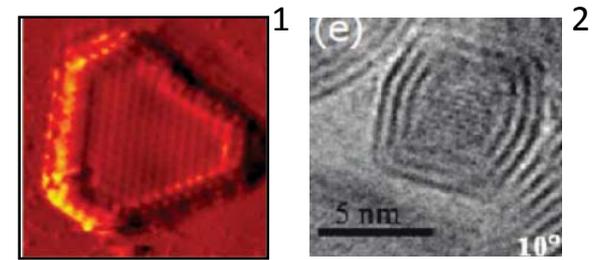

# Accomplishments: Catalysis for hydrogen evolution

Take home message:

Nanoparticles are active catalysts for the hydrogen evolution reaction (HER).

However, the data suggest that the HER may not be taking place at edge sites.

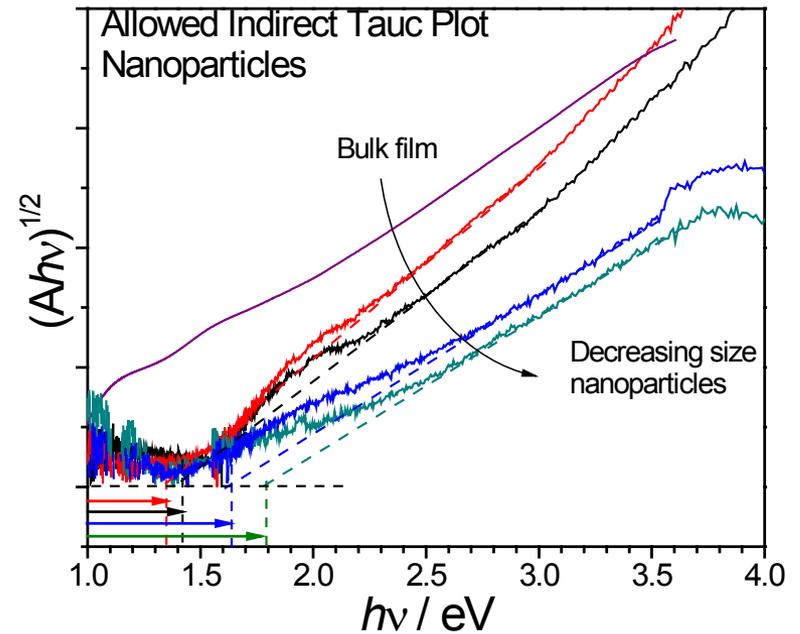

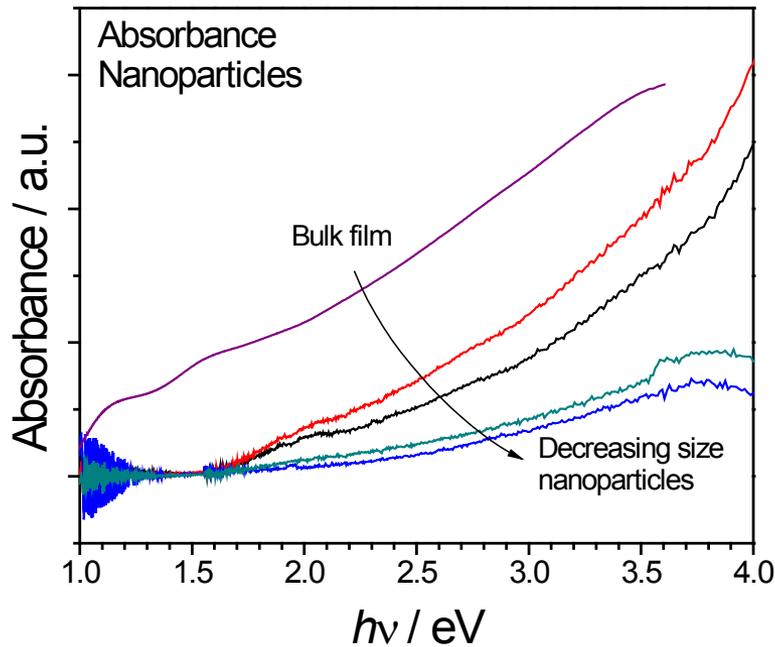

<sup>1</sup>Jaramillo, et al. *Science* **2007**, 317, 100

<sup>2</sup>Seifert, et al. *Chem. Mater.* **2009**, 21, 5629

	$j_0$ (A/cm <sup>2</sup> <sub>geometric</sub> )	$b$ (mV/decade)
PS(266)- <i>b</i> -P2VP(41)	$7.3 \times 10^{-8}$	200
PS(313)- <i>b</i> -P2VP(74)	$7.5 \times 10^{-8}$	197
PS(779)- <i>b</i> -P2VP(200)	$1.3 \times 10^{-7}$	200
PS(1654)- <i>b</i> -P2VP(400)	$1.0 \times 10^{-7}$	192

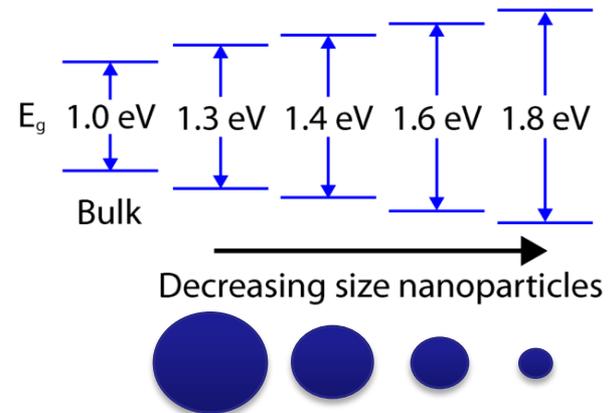

# Accomplishments: Bandgap tuning through size control

## Take home message:

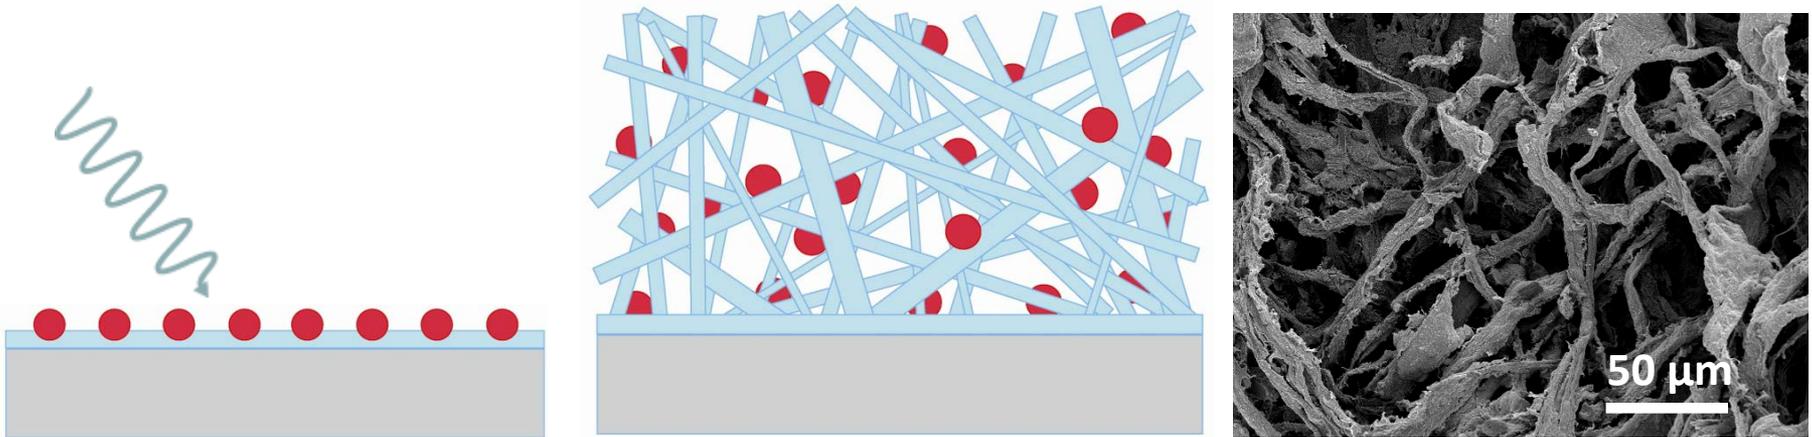

Nanoparticles of approx. 5 nm diameter exhibited a bandgap enlargement from 1.2 eV (bulk) to approx. 1.8 eV, very close to the 2013 and 2018 DOE targets of 2.0 eV - 2.3 eV.

Blueshift in bandgap with decreasing size.

# Accomplishments: Macroporous scaffold for nanoparticles

Courtesy of Yen-Chu Yang

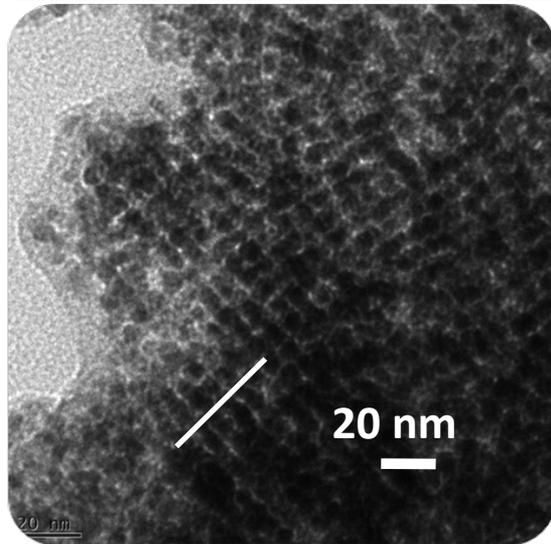

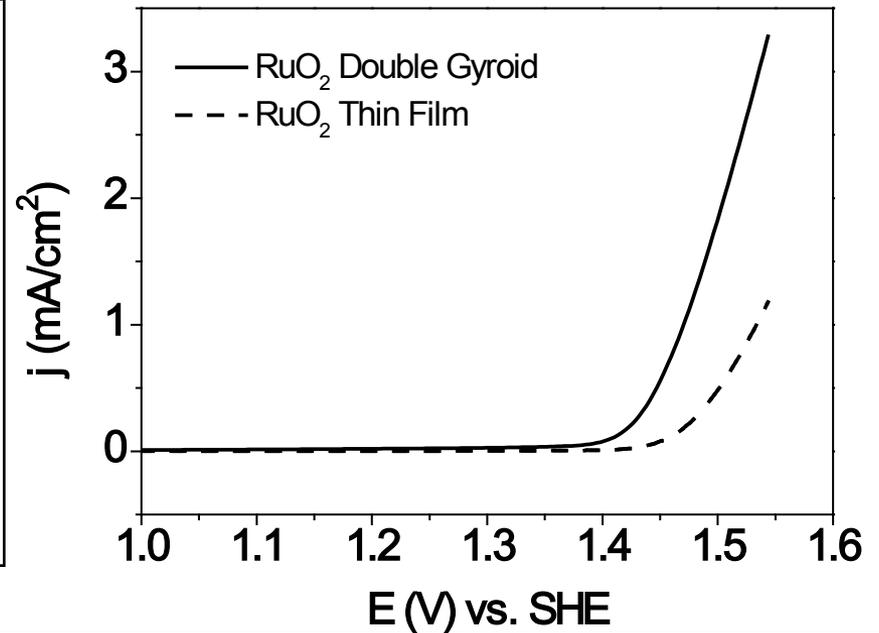

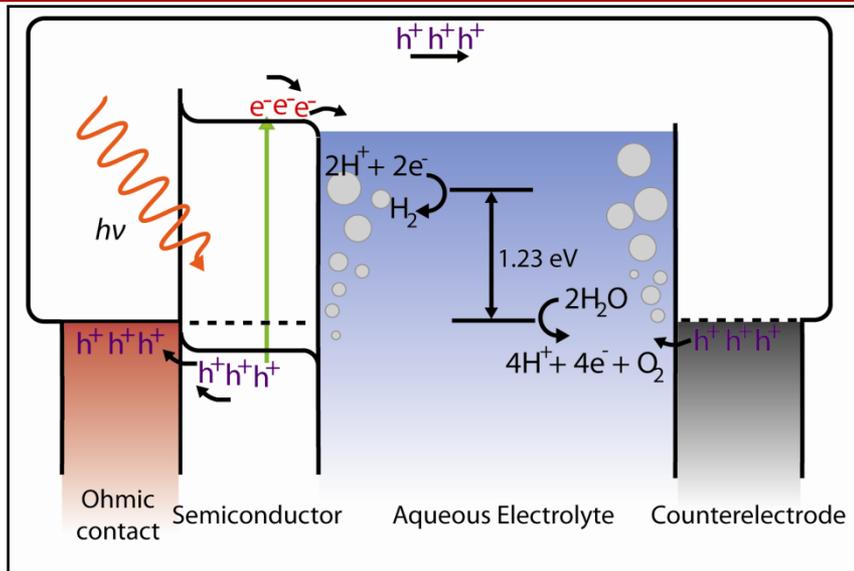

## Take home message:

In order to increase light absorption, we have initiated the development of a macroporous scaffold consisting of a transparent conducting oxide (TCO) – indium-tin oxide – upon which the MoS<sub>2</sub> nanoparticles can be vertically integrated.

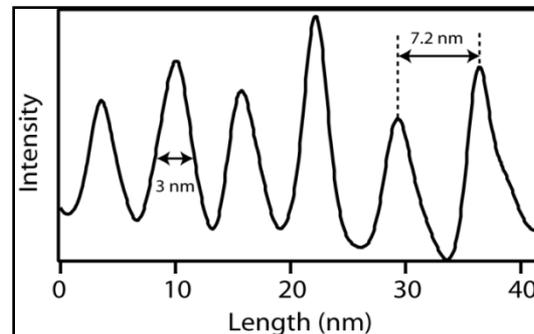

Y. Aoki, J. Huang, T. Kunitake, *J. Mater. Chem.*, 2006, **16**, 292-297

# Accomplishments: Development of a high surface area active counter electrode for water oxidation

	$j_0$ (A/cm <sup>2</sup> )	$C_{dl}$ (mF)
RuO <sub>2</sub> Thin film	$3.7 \times 10^{-9}$	0.34
RuO <sub>2</sub> Double-Gyroid	$7.1 \times 10^{-8}$	3.15

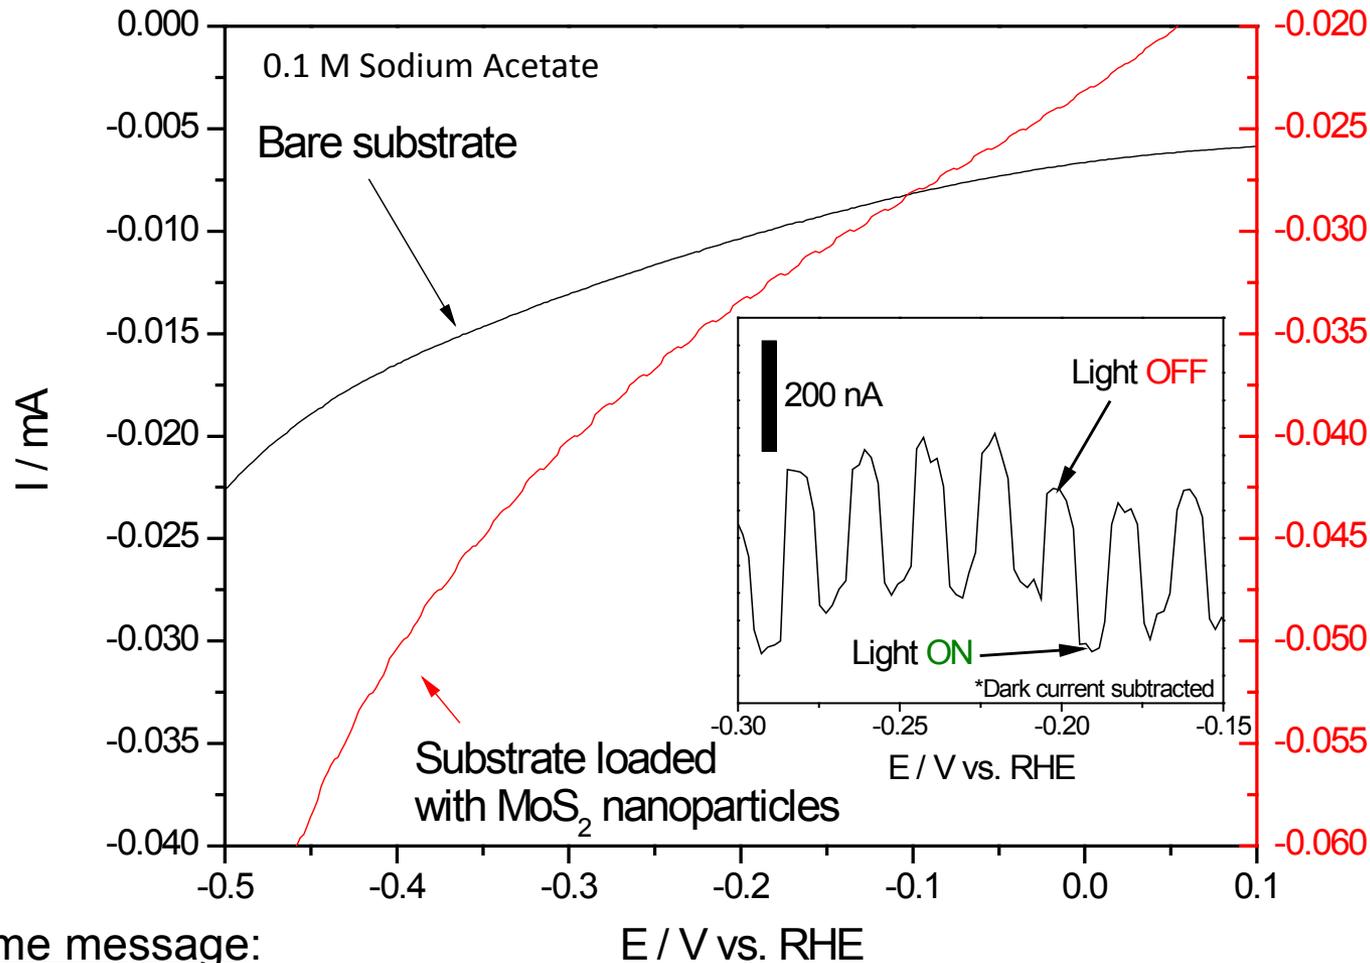

## Take home message:

P-type PEC semiconductors (such as p-MoS<sub>2</sub>) require a good water oxidation catalyst for the counter electrode. We have developed a highly active RuO<sub>2</sub> for this purpose.

# Accomplishments: Photocurrent measurements from nanoparticulate MoS<sub>2</sub> loaded onto macroporous scaffolds

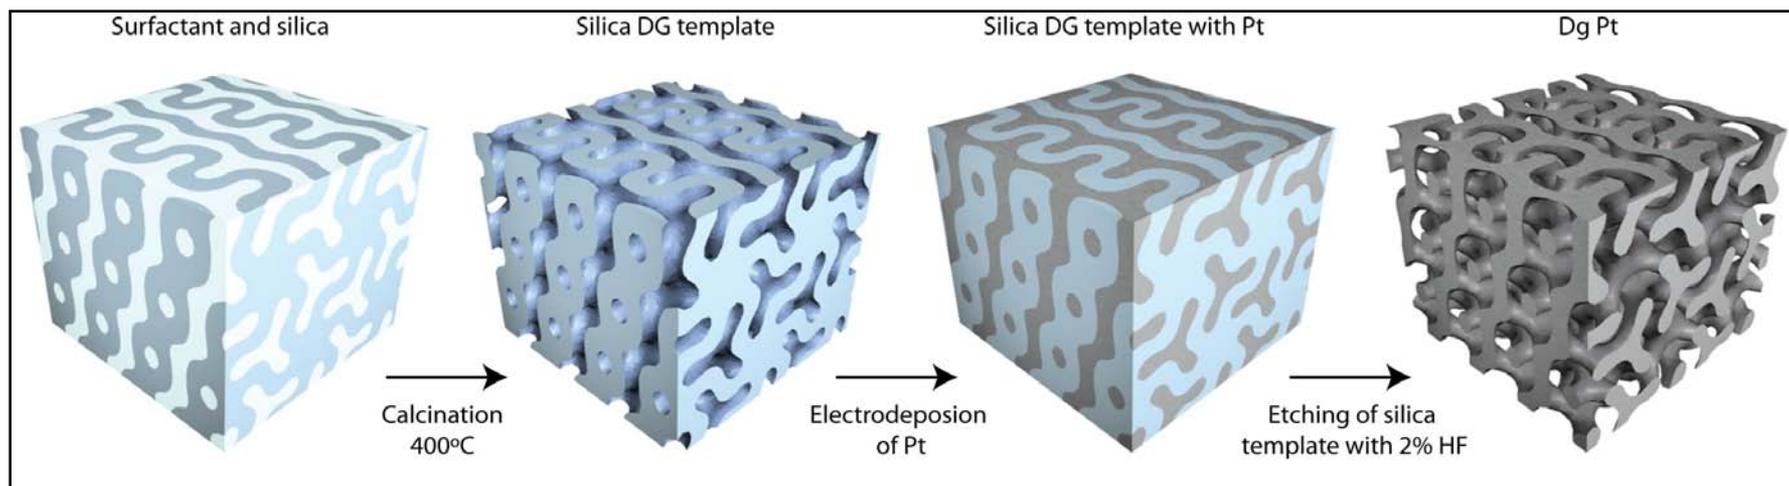

## Take home message:

We have measured p-type photoelectrochemical activity from the MoS<sub>2</sub> nanoparticles. They were loaded onto the TCO scaffold described previously, along with the RuO<sub>2</sub> counter electrode. These measurements inspire continued research in this area (go no-go).

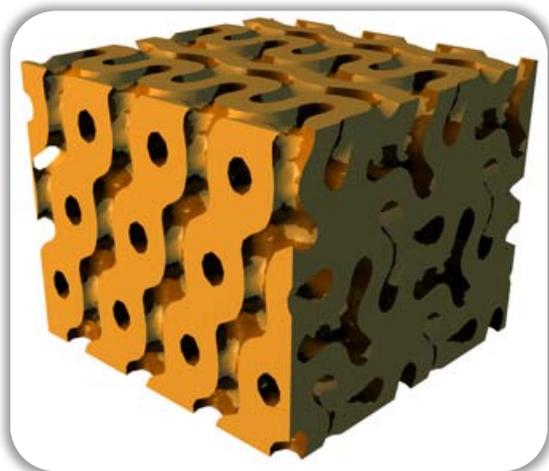

# Accomplishments: The development of mesoporous double-gyroid materials for PEC

$\text{H}(\text{CH}_2\text{CH}_2\text{O})_{17}-(\text{CH}(\text{CH}_3)\text{CH}_2\text{O})_{12}-\text{C}_{14}\text{H}_{29}$   
+ Tetraethyl orthosilicate

Artist: Jakob Kibsgaard

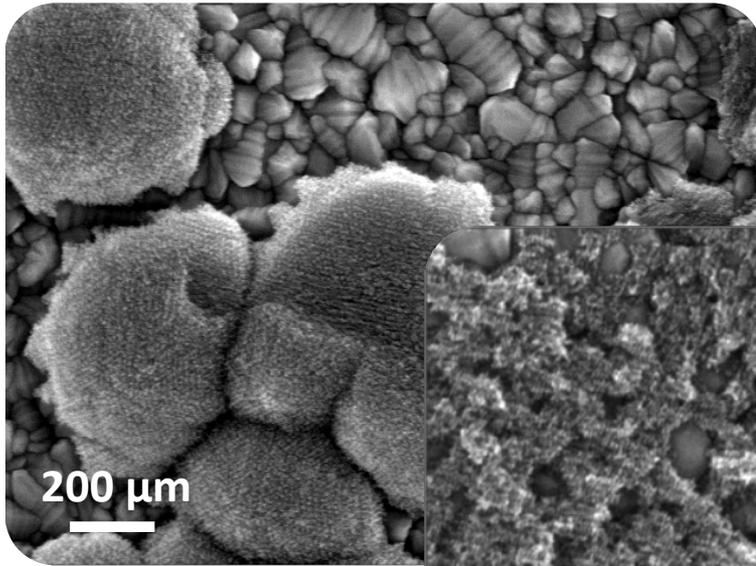

## Take home message:

We are pursuing this mesoporous structure for active counter electrode catalysts (Pt for hydrogen evolution,  $\text{RuO}_2$  for oxygen evolution) as well as for quantum confined photoelectrode materials ( $\text{MoS}_2$ ).

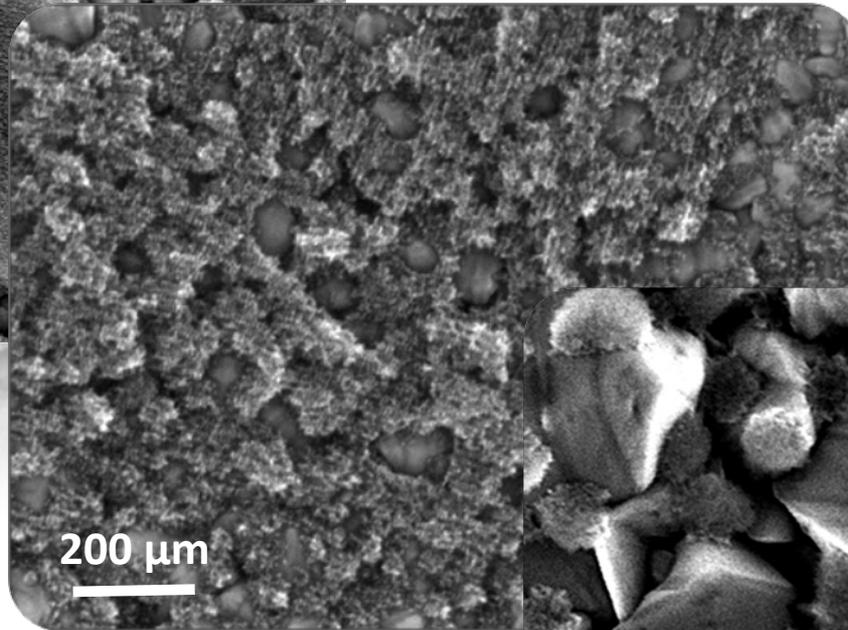

V. Urade, T.-C. Wei, M. Tate, J. D. Kowalski, H. Hillhouse, *Chem. Mater.*, 2007, **19**, 768

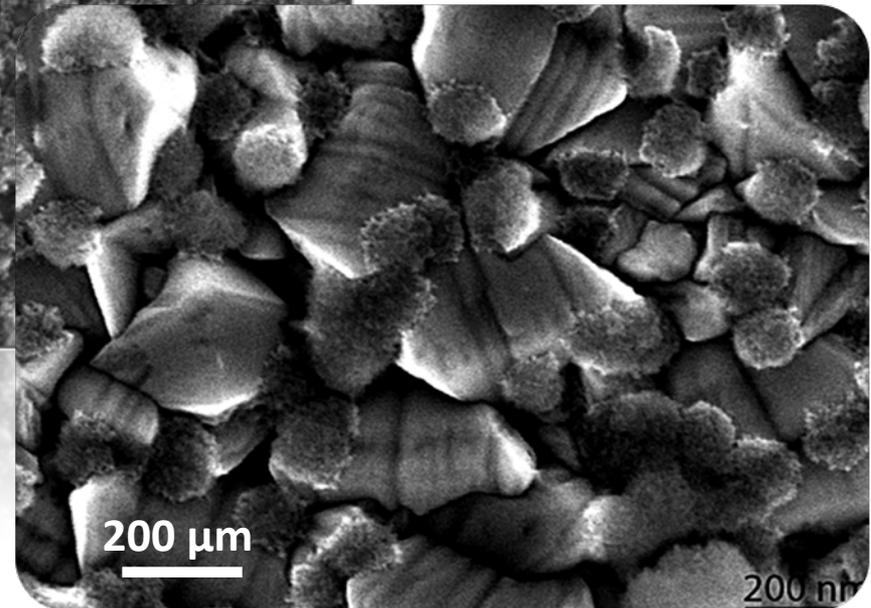

# Accomplishments: Mesoporous double gyroid (DG) Pt, RuO<sub>2</sub> and potentially Mo

Pt DG

Ru DG

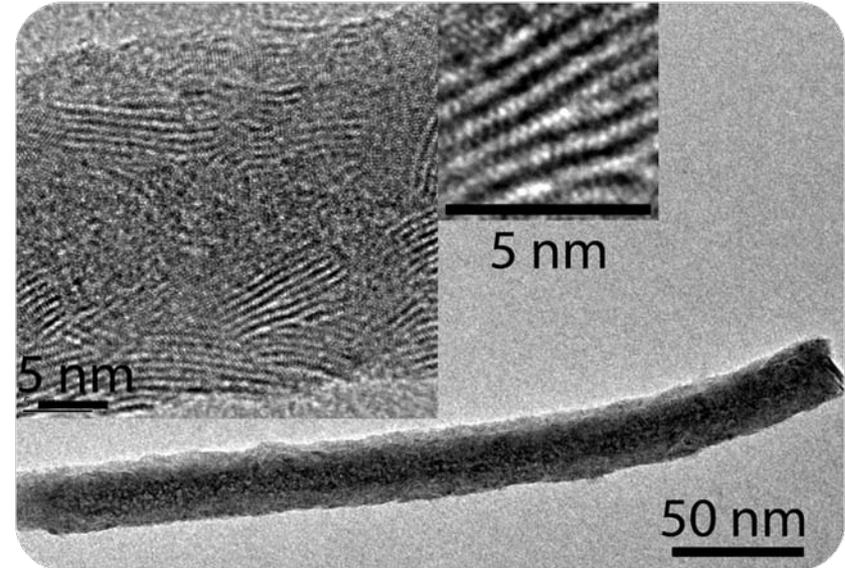

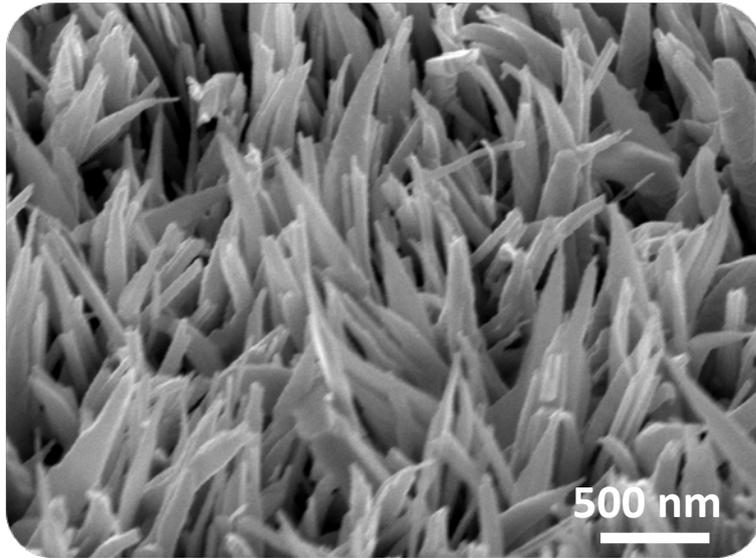

Mo DG(?)

## Take home message:

Microscopy confirms the mesoporous double-gyroid structure for Pt and RuO<sub>2</sub>, though continued work is necessary for the case of Mo.

# Accomplishments: Nanowire MoS<sub>2</sub> synthesis and characterization in collaboration with the University of Louisville, Kentucky

Courtesy: Ben Reinecke

## Take-home message:

MoS<sub>2</sub> nanowires were developed in collaboration with Prof. Mahendra Sunkara and student Dustin Cummins at the University of Louisville, Kentucky. MoO<sub>3</sub> nanowires were prepared by hotwire chemical vapor deposition in Louisville, and then sent to Stanford for sulfidization and characterization by TEM. The TEM image above (right) shows the layered MoS<sub>2</sub> structure after sulfidization.

# Collaborations

- Univ. of Louisville, Kentucky
  - Development of MoS<sub>2</sub> nanowires for PEC.
    - supported by DOE H<sub>2</sub> program.
- NREL, UCSB, UNLV, U. Hawaii.
  - Development of standardized testing and reporting protocols for PEC material/interface evaluation.
    - all supported by DOE H<sub>2</sub> program.
- NREL, UCSB, U. Hawaii, Directed Technologies, Inc.
  - Techno-economic analysis of PEC Hydrogen production systems
    - all supported by DOE H<sub>2</sub> program.
- UCSB
  - Sample-swapping for PEC measurement validation
    - supported by DOE H<sub>2</sub> program.
- UNLV
  - Collaboration with Prof. Clemens Heske for bulk and surface materials characterization by electronic spectroscopies
    - supported by DOE H<sub>2</sub> program.

# Proposed Future Research

- **Synthesis – morphologies**
  - Continue research on the double-gyroid mesoporous structure of MoS<sub>2</sub>.
  - Develop ultra-thin films of MoS<sub>2</sub> (1-15 nm). Deposit onto:
    - Flat substrates
    - High surface area nanowires – metals and transparent conducting oxides.
- **Synthesis – control over composition**
  - Identify and explore dopants to create p-type MoS<sub>2</sub>.
  - Controlled synthesis of p-type nanostructured MoS<sub>2</sub>.
- **Continued opto-electronic characterization** to identify structures with optimal electronic band structure.
- **Continued electrochemical & PEC characterization** for flat-band potentials, hydrogen evolution catalysis, solar-to-hydrogen efficiency, durability, etc.
- **Continued collaboration with PEC Working Group partners** to elucidate any material shortcomings (carrier lifetime, mobility, defects, etc.)

# Summary

- **Relevance** The **main objective** of the project is to develop new photoelectrode materials that can potentially meet DOE targets (2013 and 2018) for usable semiconductor bandgap, chemical conversion process efficiency, and durability.
- **Approach** The approach is different from previously published approaches in PEC. We aim to quantum confine semiconductors through nanostructure to tailor their bulk and surface properties for PEC.
- **Technical Accomplishments & Progress** By synthesizing MoS<sub>2</sub> nanoparticles of various sizes, we have tuned the band gap from 1.2 eV to 1.8 eV, a value very close to DOE's 2013 and 2018 targets of 2.3 eV and 2.0 eV, respectively.
- **Collaborations** Collaborations with the U. Louisville, NREL, UCSB, U. Hawaii, UNLV, and Directed Technologies, Inc. have been fruitful in terms of material development, knowledge exchange and sample-swapping for efficiency validation.
- **Future Research** Improving control over various morphologies, sizes, and compositions of nanostructures is currently underway. Characterization for physical, opto-electronic, and electrochemical properties, as well as for PEC efficiency will continue.
