Distributed Bio-Oil Reforming

2011 Annual Merit Review and Peer Evaluation Meeting

Stefan Czernik

May 9-13, 2011

Project ID# PD004
Overview

**Timeline**
- Start date: 2005
- End date: 10/2011*
- Percent complete: 85%

**Budget**
- Total Project Funding: 2,350K
- Funding received in FY 2010: $500K
- Funding for FY 2011: $400K

**Production Barriers**
A. Fuel processor capital
C. Operations and maintenance
D. Feedstock issues
F. Control and safety

**2012 Targets**
- $3.80/gallon gasoline equivalent
- 72% energy efficiency (bio-oil to \(\text{H}_2\))

**Partners**
- Colorado School of Mines – Oxidative cracking.
- University of Minnesota – Catalyst development.
- Chevron – Feedstock effects (3-year CRADA).

Project continuation and direction determined annually by DOE.
Relevance

• Biomass can be an important resource for hydrogen production.
  − 1.3 Gt/year biomass available for energy and fuels production represents potential for 100 Mt/year hydrogen that could supply 300 million fuel cell vehicles.
  − Producing hydrogen from domestic resources, such as biomass, can reduce dependence on petroleum and yield virtually zero greenhouse gas emissions.

• This project addresses the challenge of cost reduction of distributed hydrogen production from renewable liquids.
Biomass fast pyrolysis produces high yields of a liquid product, bio-oil, which can be stored and shipped to a site for renewable hydrogen production.

NREL is investigating catalytic autothermal reforming of bio-oil for this application.
**Pyrolysis:**

\[
\text{CH}_{1.46}\text{O}_{0.67} \rightarrow 0.71\text{CH}_{1.98}\text{O}_{0.76} + 0.21\text{CH}_{0.1}\text{O}_{0.15} + 0.08\text{CH}_{0.44}\text{O}_{1.23}
\]

Biomass        Bio-Oil (75%)        Char (13%)        Gas (12%)

**Catalytic Steam Reforming of Bio-oil:**

Bio-oil - 90 wt% of feed + CH\(_3\)OH - 10 wt% of feed
Elemental formula of the combined feed: CH\(_{2.18}\)O\(_{0.78}\)
H\(_2\)O (steam to carbon molar ratio = 2-3)

**Overall Reaction:**

\[
\text{CH}_{2.18}\text{O}_{0.78} + 0.51\text{O}_2 + 0.19 \text{H}_2\text{O} \rightarrow \text{CO}_2 + 1.28 \text{H}_2
\]

*Estimated Practical Yield: 10 wt%*

*Estimated Energy Efficiency: 72% LHV H\(_2\) out/(LHV in + input energy)*
Distributed Bio-Oil Reforming Approach

Staged Process Concept and Related Research Areas

Enabling Research:
- Oxidative Cracking Kinetics and Mechanisms
- Low-Temperature Catalytic Oxidation Mechanisms

Oxidative Cracking

Atomization

Bio-Oil (+MEOH)

\(~400^\circ C\)

Oxygen

\(O_2\)

\(~650^\circ C\)

Catalytic Auto-Thermal

H\(_2\)O

\(H_2O\)

H\(_2\)

Air

\(H_2O, CO, CH_4, CO_2\)

Separation

Process Integration:

\(Q\)

\(H_2O + CO_2\)

Engineering Testing

Catalyst Screening

Heat and Mass Balance

Process Optimization
Objectives

Overall

Develop the necessary understanding of the process chemistry, compositional effects, catalyst chemistry, deactivation, and regeneration strategy as a basis for process definition for automated distributed reforming; demonstrate the technical feasibility of the process.

FY 2011

• Select a commercial catalyst for autothermal reforming of bio-oil.
• Construct an integrated system for producing hydrogen from bio-oil.
• Demonstrate operation of the integrated autothermal system for producing hydrogen from bio-oil at 100 L/h.
Technical Accomplishments

FY 2008
- Designed and built a bench-scale reactor system

FY 2009
- Demonstrated operation of a bench-scale reactor system using 90 wt% bio-oil/10 wt% methanol mixture

FY 2010
- Demonstrated 60 hours of catalyst performance
- 7.3 g H₂ produced per 100 g bio-oil (9.5 g/100 g bio-oil after water-gas shift)

FY 2011
- Achieved yield of 10.1 g H₂ per 100 g bio-oil
We demonstrated hydrogen production by auto-thermal reforming of bio-oil in a bench-scale reactor system in FY 2009/2010.

Using a commercial catalyst, the hydrogen yield was 10.1g/100g bio-oil in Sept., 2010 (compared to 6.6g/100g bio-oil at the end of 2009).

For a 1,500 kg/day hydrogen plant, the total production cost was estimated at $2.70/gge. Compression and dispensing costs bring the total projected cost of hydrogen to $4.63/gge.
Process Performance Demonstration

Bench-Scale Fixed-Bed Continuous Flow Reactor System
Process Performance Demonstration

BASF 0.5% Pt/Al$_2$O$_3$ catalyst; 850°C; O/C=0.9; S/C= 2.9; GHSV=2100 h$^{-1}$

10.1 g H$_2$/100 g bio-oil
Yield of Hydrogen at Different Space Velocities

BASF 0.5% Pt/Al₂O₃ catalyst; 850°C O/C=0.9; S/C=2.9

WHSV=0.6 is required to produce high yields of hydrogen.
Construction and Shakedown of Integrated System

Construction of the reactors in progress
Hydrogen separator will be loaned from H2Pump
Process Analysis

Conceptual Process Diagram

NOMINALLY
- Steam / Carbon = 3.0
- O₂/Carbon = 0.7
- Methanol / Bio Oil = 10 wt%

NREL - lead design
Industry - available subsystems
Process Analysis

Hydrogen Cost (2005$, \textit{n}^{\text{th}} \text{ plant})

1500 kg/day station used for H2A analysis

(Current projected high volume cost based on 2011 performance)

• Capital costs $1,780,000 or $2.13/gge
  $1.29/gge for compression and distribution
  $0.84/gge for production

• Total cost of delivered hydrogen $4.63/gge
  $2.75/gge for production
  $1.88/gge for compression and distribution
Collaborations

- **Colorado School of Mines**
  - POX of bio-oil
  - POX modeling

  CSM undergraduate students participate in bench-scale experiments at NREL

- **Chevron**
  - Feedstock variability

- **University of Minnesota**
  - Catalyst development
Summary

- Bench-scale reactor system tests of catalytic autothermal reforming of bio-oil continued using 90 wt% bio-oil/10 wt% methanol mixtures.
- The catalysts:
  - 0.5% Pt on Al₂O₃ pellets and monolith provided by BASF were tested using different space velocities.
- Carbon-to-gas conversion was 88%–91%.
- At 850°, O/C=1.5, S/C=2.9, and GHSV=2100, 10.1 g hydrogen was produced from 100 g bio-oil/methanol feed.
- The estimated cost of hydrogen production: $2.73/gge.
- The construction of an integrated system for producing 100 L/h of hydrogen by autothermal reforming of bio-oil is in progress.

Proposed Future Work

- FY 2011: Complete integrated prototype system producing 100L/h hydrogen from bio-oil
- FY 2012: Long duration runs to demonstrate at least 100 hours of the catalyst performance and to validate the operation of the integrated system.
