Hydrogen Storage System Modeling: Public Access, Maintenance, and Enhancements

Presenter: David Tamburello

Team: Matthew Thornton, Sam Sprik, and Kriston Brooks

June 15, 2018

ST008

This presentation does not contain any
proprietary, confidential, or otherwise
restricted information

Overview

Timeline

- **Start: October 1, 2015**
- **End: September 30, 2018**
- **80% Complete (as of 5/1/18)**
 - **\$950,000 Spent (as of 5/1/18)**

Budget

- **Total Project Funding: \$1,100,000**
 - **FY16 Funding: \$336,000**
 - **FY17 Funding: \$389,000**
 - **FY18 Funding: \$375,000**

Barriers

- A. System Weight and Volume**
- B. System Cost**
- C. Efficiency**
- E. Charging/Discharging Rates**
- I. Dispensing Technology**
- K. System Life-Cycle Assessment**

Partners

Relevance

Collaborative effort to manage, update, and enhance hydrogen storage system models developed under the Hydrogen Storage Engineering Center of Excellence (HSECoE).

- Transfer engineering development **knowledge from HSECoE on to future materials research.**
- Manage the **HSECoE model dissemination** web page.
- Manage, update, and enhance the **modeling framework and the specific storage system models** developed by the HSECoE.
- Develop models that will **accept direct materials property inputs** and can be measured by materials researchers.
- **Ultimate Goal: Provide modeling tools that will be used by researchers to evaluate the performance their new materials in engineered systems relative to the DOE Technical Targets.**

Relevance – Barriers Addressed with Models

Barriers	Model Addressing Barrier
A. System Weight and Volume	System Estimator
B. System Cost	Tank Volume/Cost Model
C. Efficiency	Framework Model <ul style="list-style-type: none">- On-Board Efficiency- Fuel Economy
E. Charging/Discharging Rates	Framework Model <ul style="list-style-type: none">- Drive cycles
I. Dispensing Technology	Framework Model <ul style="list-style-type: none">- Initial and Final System Conditions
K. System Life-Cycle Assessment	All Models

Relevance – Challenge to Materials Researchers: Evaluating Materials Relative to the DOE Technical Targets

Home

The Hydrogen Storage Engineering Center of Excellence (HSECoE) is working to help reduce our Nation's dependence on foreign energy sources by changing the way we power our cars, homes, and businesses. The HSECoE was selected through a competitive, merit reviewed solicitation process by DOE.

The Center addresses the significant engineering challenges associated with developing low-pressure, materials-based, hydrogen storage systems for hydrogen fuel cell and internal combustion engine light-duty vehicles.

The project is incorporated into the DOE's Fuel Cell Technology Program, which consists of applied research and development activities, conducted through Center of Excellence materials and engineering teams, and independent projects focusing on materials and concepts, testing, and system analysis.

Accomplishments and Progress – Stand-Alone Design Tools

Estimate All Input Parameters Needed for the Framework

Design Tool Benefits:

- **Availability (No Simulink license required)**
- **Uses inputs measured by materials researchers to calculate Framework parameters**
- **Estimates system mass and volume for preliminary comparison to the DOE Technical Targets**
- **Can be run separate or can be run as a GUI within the framework**

Accomplishments and Progress – Chemical Hydrogen (CH) Stand-Alone System Design Tool

Additional capability this year

- Volume-based vs. Original useable H₂-based estimate
- Use calculated useable H₂ in Framework to estimate vehicle range

Accomplishments and Progress – Adsorbent (AD) Stand-Alone System Design Tool

Updates and Additional Capability this year

- **Extended system design options to room temperature and cold-gas temperature system design options**
 - **With original cryogenic temperature system operation**
- **UNILAN-based system design formulation (In Progress)**
 - **With original Dubinin-Astakhov (D-A) system design formulation**
- **Total H₂ storage system volume-based system design**
 - **With original useable H₂-based system designs**
- **Use estimate system design parameters within the Framework to estimate vehicle performance**

Accomplishments and Progress – Representative Results for ADS

Adsorbent Material	Gravimetric Capacity [g _{H2} /g _{sys}]	Volumetric Capacity [g _{H2} /L _{sys}]	Source
MOF-5 Powder [130 kg/m ³]	0.0338 g _{H2} /g _{sys}	18.6 g _{H2} /L _{sys}	SRNL / HSECoE
MOF-5 Compact [406 kg/m ³]	0.0314 g _{H2} /g _{sys}	21.3 g _{H2} /L _{sys}	SRNL / HSECoE
MOF-5 Powder [200 kg/m ³]	0.0332 g _{H2} /g _{sys}	19.6 g _{H2} /L _{sys}	SRNL / HSECoE
UMCM-9 Powder* [200 kg/m ³]	0.0345 g _{H2} /g _{sys}	20.5 g _{H2} /L _{sys}	Ford / U. of Michigan
MOF-177 Powder* [200 kg/m ³]	0.0340 g _{H2} /g _{sys}	20.2 g _{H2} /L _{sys}	Ford / U. of Michigan
SNU-70 Powder* [200 kg/m ³]	0.0341 g _{H2} /g _{sys}	20.2 g _{H2} /L _{sys}	Ford / U. of Michigan
DUT-23 (Co) Powder* [200 kg/m ³]	0.0340 g _{H2} /g _{sys}	20.2 g _{H2} /L _{sys}	Ford / U. of Michigan
IRMOF-20 Powder* [200 kg/m ³]	0.0336 g _{H2} /g _{sys}	19.9 g _{H2} /L _{sys}	Ford / U. of Michigan

*Special thanks to Ford and the University of Michigan for sharing their data.

System Design Assumptions:

- Operating Conditions: 80 K, 100 bar to 160 K, 5 bar
- 5.6 kg of usable hydrogen (~5.71 kg of actual hydrogen storage)
- Type 1 aluminum pressure vessel
- LN₂ pressure vessel chiller channel thickness of 9.525 mm
- Uniform insulation thickness of 23 mm, with a 2 mm outer aluminum shell

Accomplishments and Progress – Metal Hydride (MH) Stand-Alone System Design Tool

Predict the mass and volume of a MH-based H₂ storage system for light duty vehicles

- **Developed in MATLAB and converted to an executable file.**
- **Microsoft Excel Input and Output**
 - **Input parameters: H₂ capacity, C_p, density, ΔH, ΔS, k**
 - **Results: System mass and volume, tank length and volume**
- **Design Tool Steps:**
 - **van't Hoff equation determines if fuel cell waste heat can be used (~85°C) or hydrogen combustor is required for > 5 atm equilibrium pressure requirement**
 - **MATLAB MHAЕ estimates cooling tube spacing required during refueling (5 minute refueling)**
 - **Calculate total mass and volume of tank interior (MT + tubes)**
 - **Tank Cost/Volume Model (estimates thickness and mass of tank)**
 - **Include mass and volume of BOP (with/without combustor)**

Accomplishments and Progress – Input Information for MH Stand-Alone System Design Tool

Material Properties			
Name	Value	Units	Description
hydcap	0.08	decimal fraction	Hydride Carrying capacity
kbed	6	W/m-K	Thermal Conductivity of Hydride Bed

System Diagram

Accomplishments and Progress – Integration of the Updated MH Model into the Full Vehicle Framework

- Perform beta testing of the MH design tool, produce an executable file, and upload onto the HSECoE website with appropriate documentation
- Update MH storage system in framework to allow alternative material evaluation
 - Currently a generic model with 30 kJ/mol enthalpy and only fuel cell waste heat required for dehydrogenation

Figure 1: Vehicle simulation framework

HSECoE Hydrogen Vehicle Simulation Framework

Select storage system: MH-GH/3s v3

Framework diagram System diagram

Generic metal hydride model 30 kJ/mol enthalpy of dehydrogenation. Note that the enthalpy of dehydrogenation that the fuel cell waste heat can be used for the dehydrogenation.

Update

Running scenario

Test case: 1 Fuel economy test (UDDS+HWY,...)

Run simulation

Storage system variables - Single run

Auxiliary loads	kW	(0.2 - 2)	0.7	Inert weight fraction	-	(0 - 0.4)	0.1
Combustor efficiency	-	(0.5 - 1)	0.9	Refueling fraction achieved	-	(0.5 - 1)	0.85
Extra volume	L	(0 - 200)	0	Refueling pressure	bar	(60 - 110)	100

Hydride mass	kg	(1 - 400)	65				
Hydride void fraction	-	(0.2 - 0.6)	0.3				

Weight fraction of pure hydride before adding inert material

Accomplishments and Progress – Vehicle Framework GUI

The screenshot displays the 'Hydrogen Vehicle Simulation Framework' interface. At the top, it shows the HSECoE logo and the title 'Hydrogen Vehicle Simulation Framework'. Below this, there are sections for 'Select storage system', 'Running scenario', and 'Vehicle Level Variables'. A 'Run simulation' button is visible. On the right side, there are four orange buttons: 'MH System Design', 'Cryo Compressed Design', 'Adsorbent System Design', and 'CH Material/Design'. A red circle highlights the 'CH Material/Design' button, with arrows pointing to a list of design options on the right: 'MH System Design - In Progress', 'Cryo Compressed Design - In Progress', 'Adsorbent System Design - Public version', and 'CH Material/Design - Public version'. Below the main interface, there are several sub-windows: 'CH_SystemDesign' showing 'Material Properties' and 'Operating Conditions', 'Load Inputs' with 'Name: CH-AB Slurry Exothermic' and 'Description: Exothermic Ammonia Borane slurry system', 'Model Parameters' with 'ExoEndo: 1' and 'Kinetic_Model: 1', and 'Design Parameters' with a table of values. A red circle highlights the 'TotalVolume' and 'TotalMass' values in the 'Design Parameters' table, with a red box below it containing the text 'Storage Volume and Mass Outputs'. A 'Run System Design' button is also visible. At the bottom, there are buttons for 'Design Documentation', 'General Documentation', 'System Diagram', and 'Exit'. A small inset window on the left shows a table of simulation results.

Accomplishments and Progress – Chemical Hydrogen Storage Variables/Settings Stored in the Matlab files

Example filename: **ch_ab_slurry_sys.mat**

Stores Matlab structure variable, HS, with info needed to run in Vehicle Framework

AMR Comments

2017 AMR Comment	2018 Response/Approach
The investigators should recognize other team members of the HSECoE that have contributed significantly to the development of these models. New model should be vetted with the HSECoE team members.	Acknowledgments will be added to the web site, presentations and papers. HSECoE team member have been engaged on new model development throughout the term of this project and that will continue as appropriate.
The team should consider including raw test data that have been collected by the HSECoE partners.	Without permission from HSECoE partners, we cannot post their raw test data. Assuming permission can be obtained, a section will be added to www.hsecoe.org where raw test data is made available.
It was not clear where and how different heat removal strategies could be explored within their models.	The current models are written to evaluate hydrogen storage materials. In the vehicle framework, the material's thermal conductivity and specific heat are used to evaluate heat removal strategies in coordination with the internal heat exchanger designs.
The lack of feedback from outside users is a project weakness	Evaluating materials from non-HSECoE members such as HyMARC and other, for example: -- Mike Veenstra, Ford Motor Co. -- Don Siegel, University of Michigan -- Jeff Long, UC Berkeley Have also conducted a user feedback survey this year.

Collaborations

Organization	Relationship	Type	Responsibility
NREL	Team Member	Federal Lab	Update Website and Framework
SRNL	Team Member	Federal Lab	Adsorbent and Compressed Gas Modeling
PNNL	Team Member	Federal Lab	Chemical Hydrogen and Metal Hydride Modeling
Ford	Consultant	Industry	Beta Testing, Fuel Cell Model, Adsorption Data
RCB Hydrides LLC	Consultant	Industry	Beta Testing, H ₂ Storage Expertise
University of Michigan	Material Developer	Academia	Adsorption Data
University of California Berkeley	Material Developer	Academia	Adsorption Data
Purdue University	Material Developer	Academia	Chemical Hydrogen Storage Reaction Rate
HyMARC	Material Research	Federal Lab / Collaboration	Material development

Remaining Challenges and Barriers

- Increase the use of the models by material developers
 - *Expand the capability of the models to include other kinetic and thermodynamic expressions*
 - *Simplify the model use for non-modelers*
- Increase the use of the models by systems engineers
 - *Potential expansion of the model capabilities to other vehicle classes*
- Demonstrate the model's utility to other researchers
 - *Applying the models to their applications*
- Find available data to validate the model

Proposed Future Work – Recent Past and Proposed Future Milestones/Deliverables

Deliverable		Date
FY17 Q3	Update web models: Stand-Alone System Design Tools, Isotherm Fitting Tool, GUI/framework.	Complete
FY17 Q4	Develop MH and compressed gas storage system design tools	Complete
FY18 Q1	Provide update on web portal activity—web site hits and time on site, web site use locations and model down loads.	Complete
FY18 Q2	Update Adsorbent and CH models with any newly available data from DOE program and/or the hydrogen storage research community.	Complete
FY18 Q3	SMART Milestone – Alternative Storage System Formulations: Update the hydrogen storage equations for additional theoretical formulation(s). (i.e. Unilan or 2-state Langmuir)	In Progress
FY18 Q4	Update models with any newly available data from DOE program and or the hydrogen storage research community.	In Progress

Any proposed future work is subject to change based on funding levels

Proposed Future Work – Next Steps in Model Development

- Include a vehicle-side refueling model within the framework to address the forecourt requirements and their effect on refueling time and energy needs.
- Include dormancy calculations in all adsorbent design tools.
- Convert Stand-alone Design Tools from .exe to Excel VBA tools.
- Continue to develop volume-based design to target specific vehicle volume limitations/designs and/or, potentially, additional vehicle classes
- Expand model to other vehicle platforms (medium and heavy duty trucks, forklifts, buses, etc.)
- Work with Material Based H₂ Storage Developers to apply models to their materials
- Maintain and enhance existing framework models and track web activity and downloads

Any proposed future work is subject to change based on funding levels

Summary

Relevance	<ul style="list-style-type: none">• Provide materials based hydrogen storage researchers with models and materials requirements to assess their material's performance in an automotive application.
Approach	<ul style="list-style-type: none">• Improve framework utility by bridging the gap between the information generated by the materials researcher and the parameters required for the framework model.
Technical Accomplishments and Progress	<ul style="list-style-type: none">• Developed system estimators for MH, CH, and Adsorbents.• System estimator used with framework GUI and as stand-alone executable.• Developed a stand-alone isotherm data fitting routine for D-A parameters.• Performed Survey• Improved website and model accessibility.
Collaborations	<ul style="list-style-type: none">• Project team includes NREL, SRNL, and PNNL.• Consultants from industry participate in team meetings and provide input.• Material developers from academia provide new material properties.
Proposed Future Research	<ul style="list-style-type: none">• Expand the use of models by demonstrating their utility with other storage materials, theoretical formulations, and vehicle class options.
